

The Lilly Open Innovation Drug Discovery Program: Present and Future

Marta Piñeiro-Núñez, Ph.D.
Lilly Research Laboratories, USA

16th SCI/RSC Medicinal Chemistry Symposium

11-14 September 2011

Churchill College, Cambridge, UK

Presentation Overview

I. Origin of the Concept

- Chemical Diversity Strategy
- Launch & Implementation of the PD² Initiative

II. PD² Metrics and Outcomes to Date

- Institutions, Users & Compound Diversity
- PD² Collaborations

III. Open Innovation Framework/Business Model

- PD² plus TargetD² & Computational models
- Lilly TB Drug Discovery Initiative

IV. What's Happening & What's Next

Presentation Overview

I. Origin of the Concept

- Chemical Diversity Strategy
- Launch & Implementation of the PD² Initiative

II. PD² Metrics and Outcomes to Date

- Institutions, Users & Compound Diversity
- PD² Collaborations

III. Open Innovation Framework/Business Model

- PD² plus TargetD² & Computational models
- Lilly TB Drug Discovery Initiative

IV. What's Happening & What's Next

Key Investments to Enable Strategies for Drug Discovery

“Distinct Target(s) Hypotheses”

“Biological Systems Hypotheses”

Molecular

Fragment Based & Molecular Design

Molecules built for purpose

Biochemical

Target Directed Screening

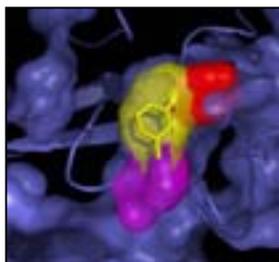

Repurpose/modify existing molecules

Cellular **In Vivo**

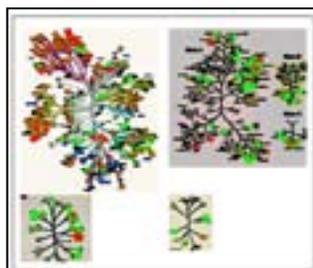

Phenotypic Drug Discovery

Uncover/optimize molecule signatures

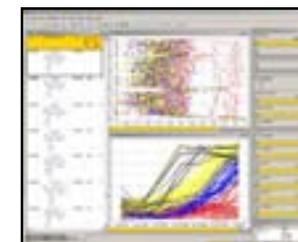

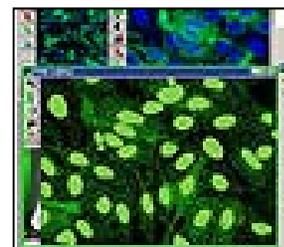

- HT Crystallography
- SPR
- HDX
- F-NMR
- High conc. Assays
- **Fragment diversity**

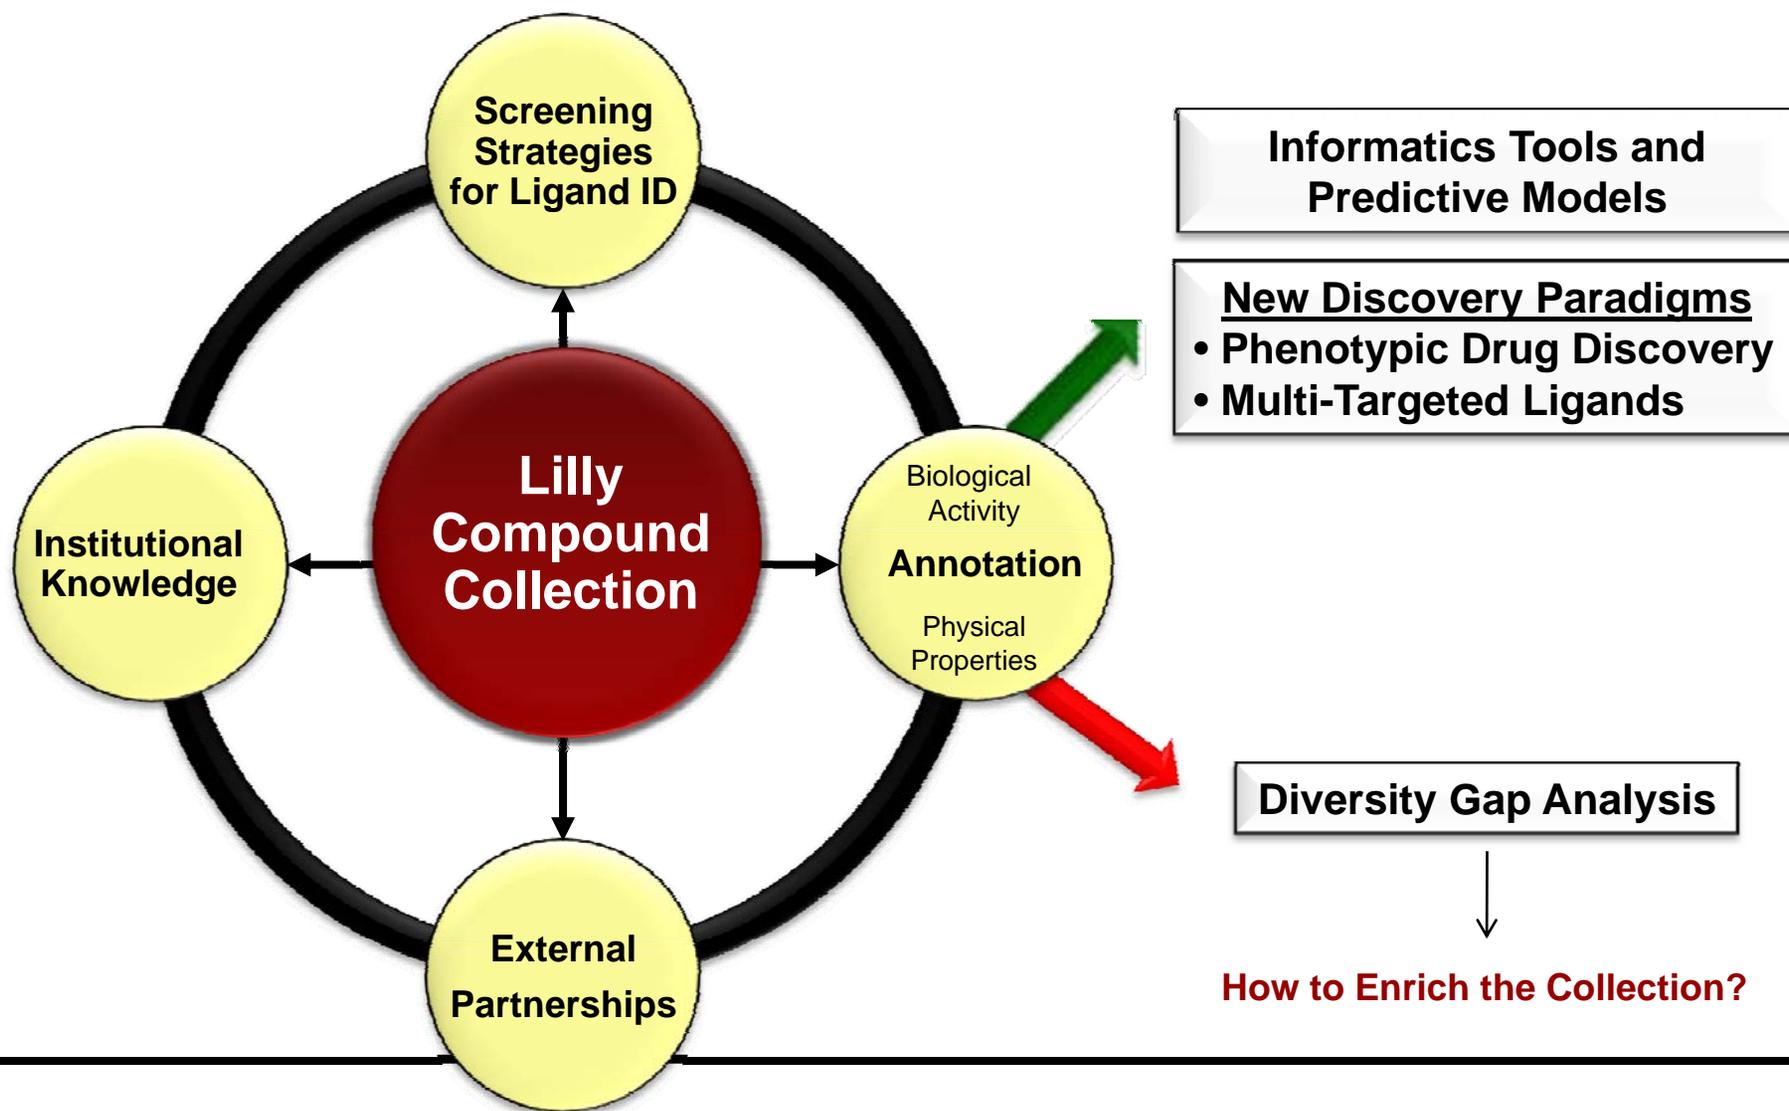

- Gene family platforms
- Diversity/iterative screening
- **Compound libraries**
- Computational models/informatics
- Structural Biology
- Cellular and biochemical assays

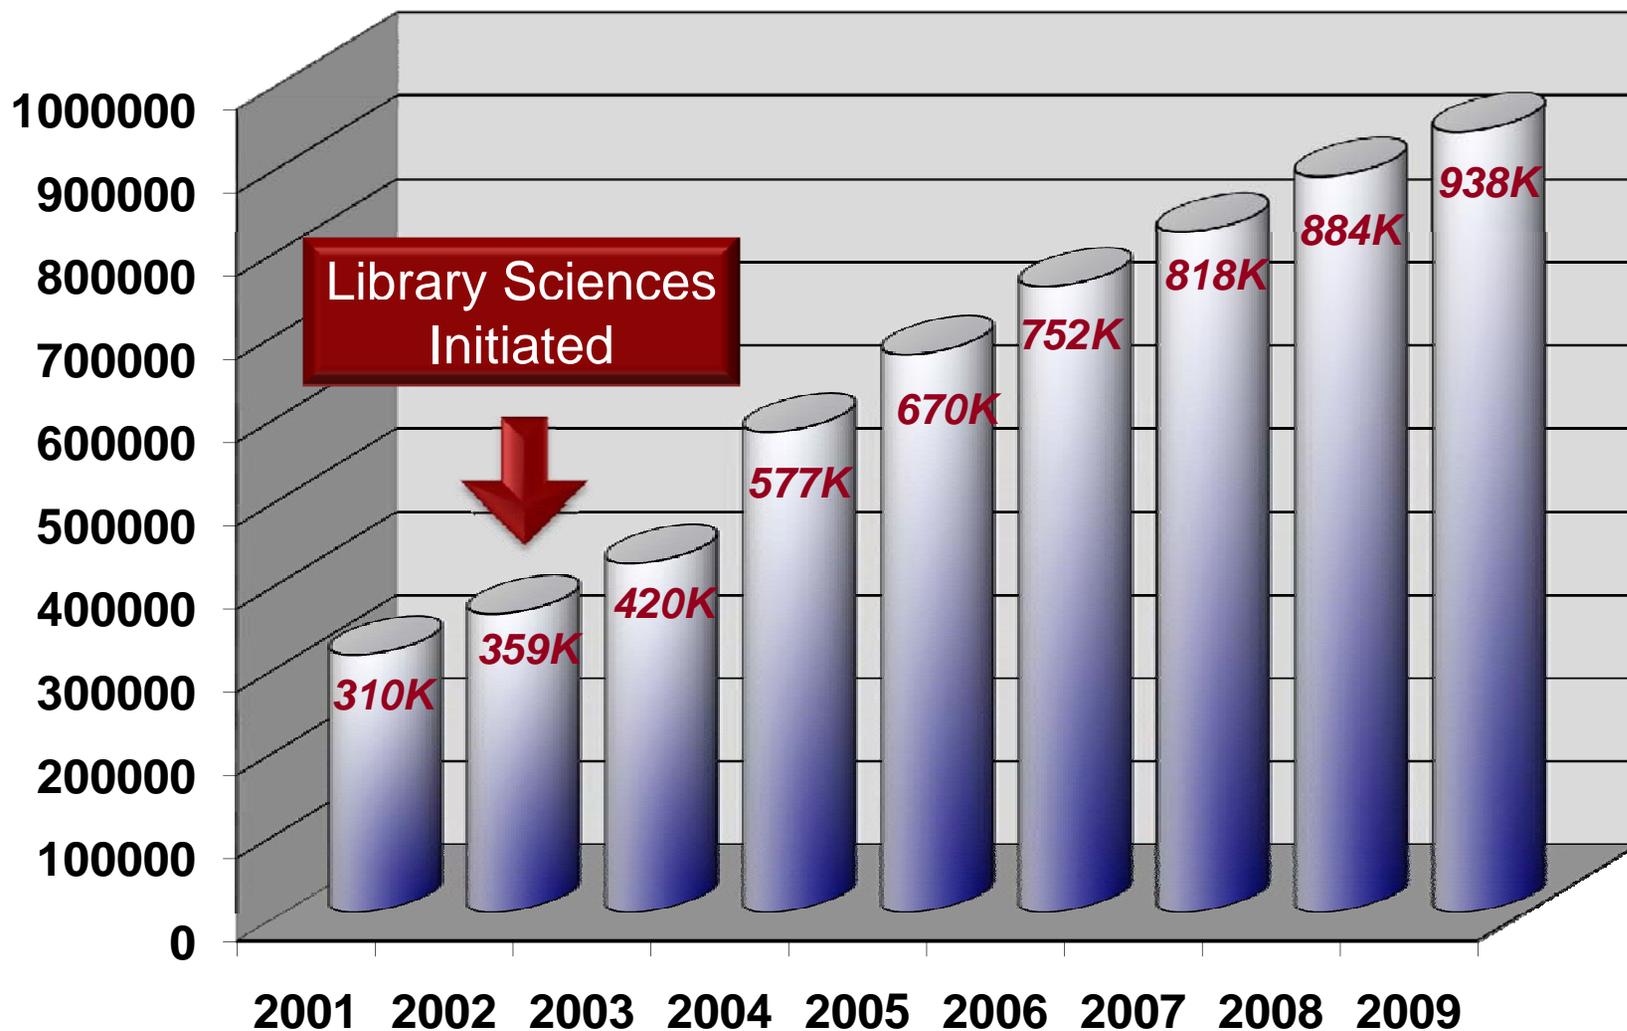

- High Content Imaging
- Advanced informatics
- **Alternative molecular diversity**
- Advanced cellular assays
- Stem cells
- Pathway analysis
- Target(s) ID

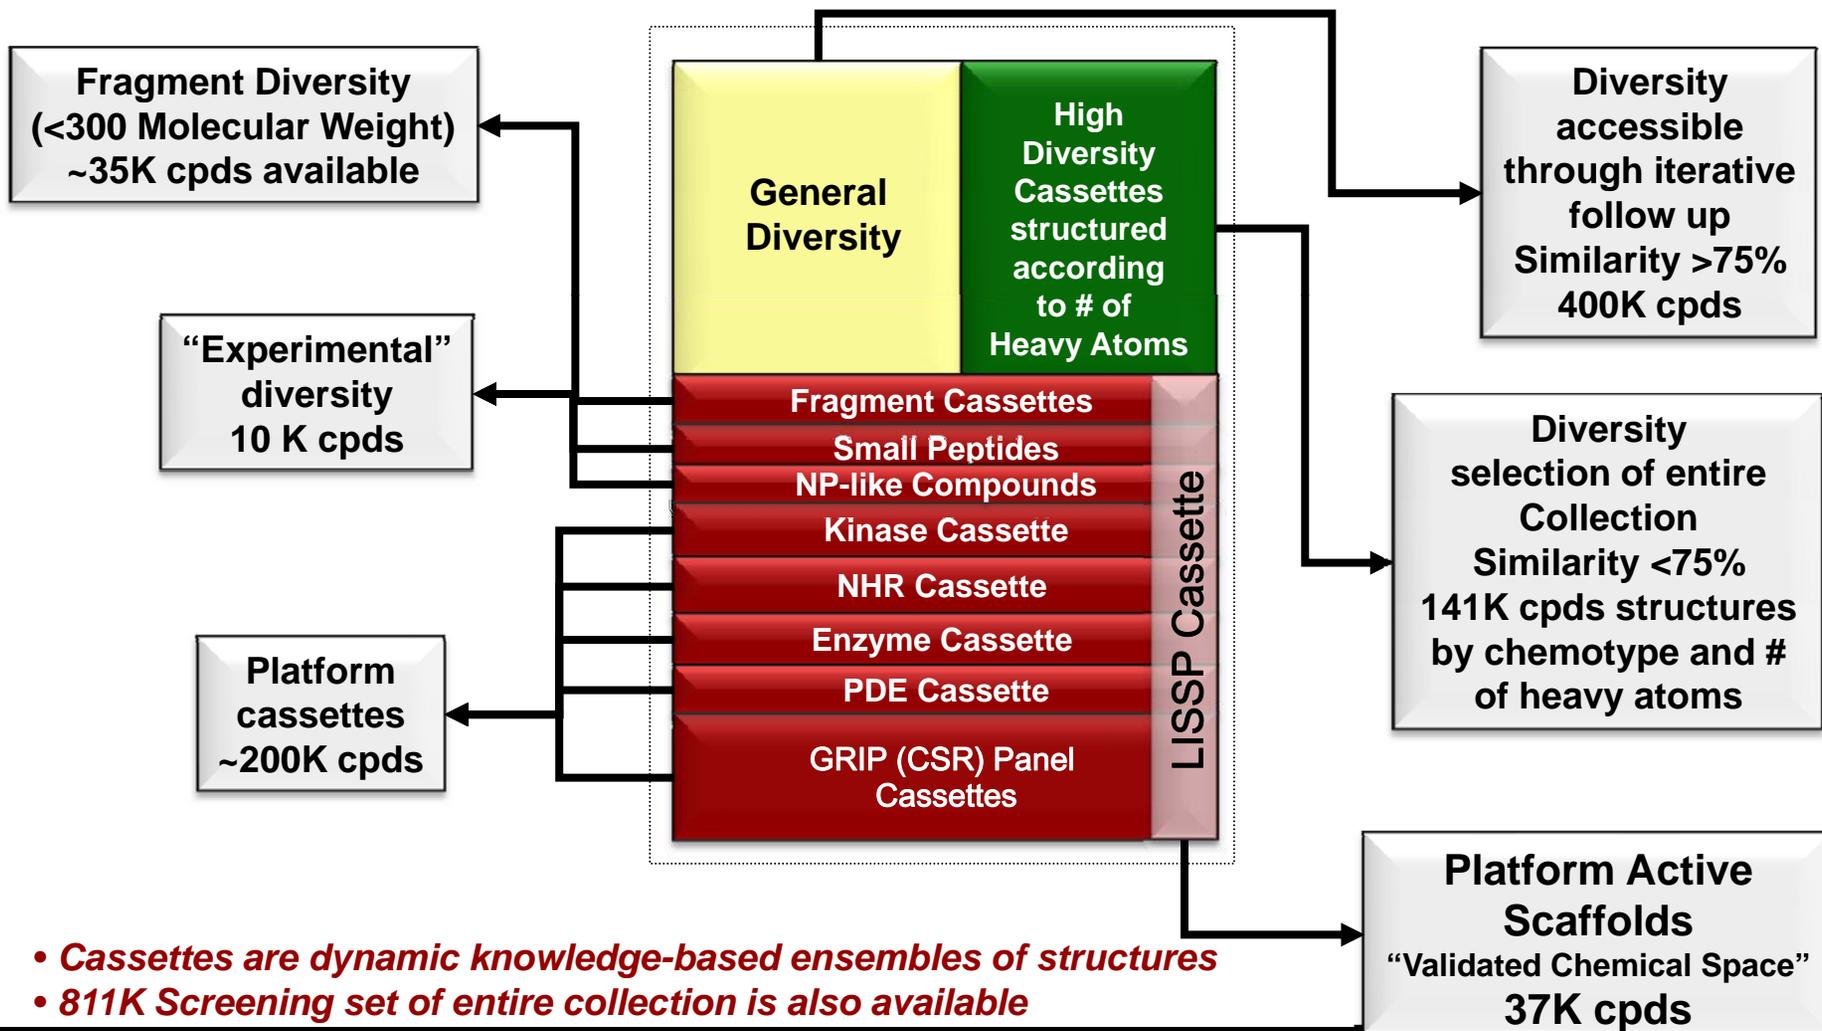

Strategic Role of Lilly Compound Collection

Unique Compound Growth in Lilly Compound Collection

Structure of Lilly Compound Collection 2010

An Alternative Concept to Gathering Chemical Diversity

Are we done with the compound collection?

- No, the compound collection needs to be dynamic and responsive to our emerging areas of disease and target strategies

What challenges & barriers do we have to evolving our compound collection?

- Identification of new sources of compounds and maintenance of a large collection brings quality & financial challenges

Are there distinct sources of molecules available that we should consider (academia and small biotech)?

- We could engage external scientists to access their compounds and ideas in a collaborative framework to advance common interests

Opportunity for Open Innovation

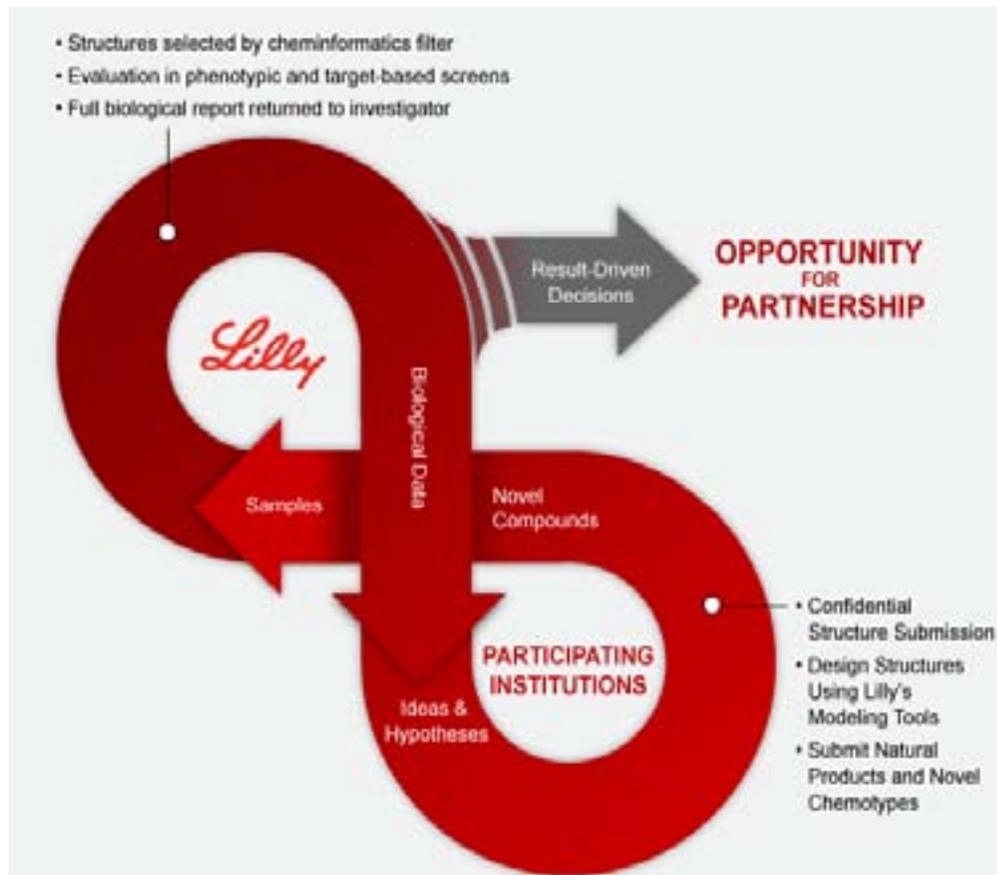

The Lilly Open Innovation Concept

We want to

- “expand” our discovery organization through access to external global scientific talent, assets and resources
- established unbiased partnerships with academics and small biotechs
- explore alternative models for interaction and value creation that leverage Lilly science

While ensuring that we

- do it via incremental costs on top of existing internal investments
- have a measurable return on investment

Implementation of the Lilly Open Innovation Drug Discovery Program

First: test the concept, then, expand on what works

September 2009 – launched Phenotypic Drug Discovery Initiative (PD²)

- Institution-level affiliation (universal MTA covers entire institution)
- External submitters gained no-cost access to select phenotypic assay panel
- Full experimental data report returned to investigators
- Lilly has first right of negotiated access or collaboration for promising molecules (pay for performance)
- Otherwise investigator is free to publish

August 2011 – added Target Drug Discovery Initiative (TargetD²) and neglected disease research module (TB)

- Leverage existing engaged community and business process
 - Dynamic assay panel evolution: state-of-the-art, relevant
 - Offer value to participants: data, models, feedback, scientific discussion
-

Presentation Overview

I. Origin of the Concept

- Chemical Diversity Strategy
- Launch & Implementation of the PD² Initiative

II. PD² Metrics and Outcomes to Date

- Institutions, Users & Compound Diversity
- PD² Collaborations

III. Open Innovation Framework/Business Model

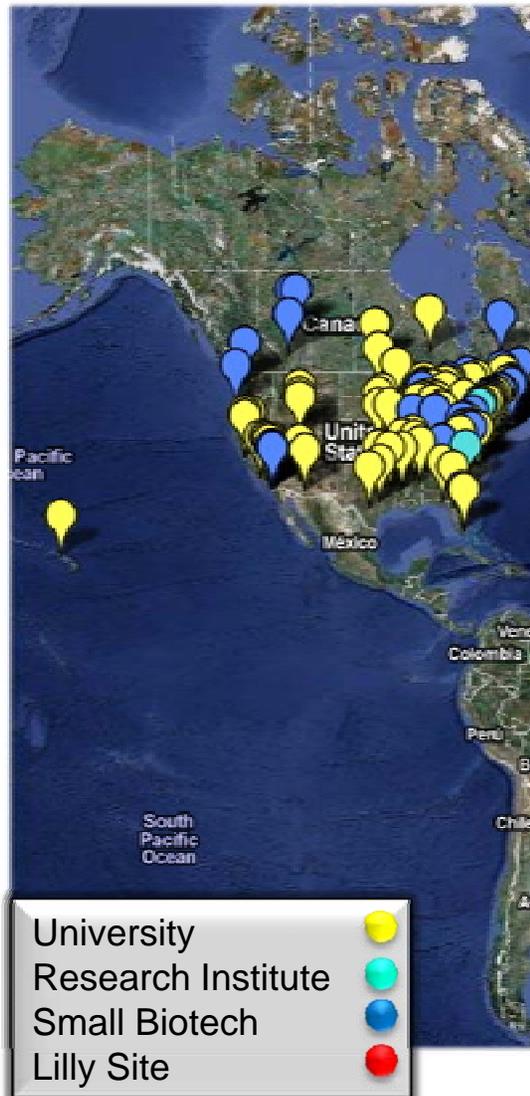

- PD² plus TargetD² & Computational models
- Lilly TB Drug Discovery Initiative

IV. What's Happening & What's Next

PD² Global Network

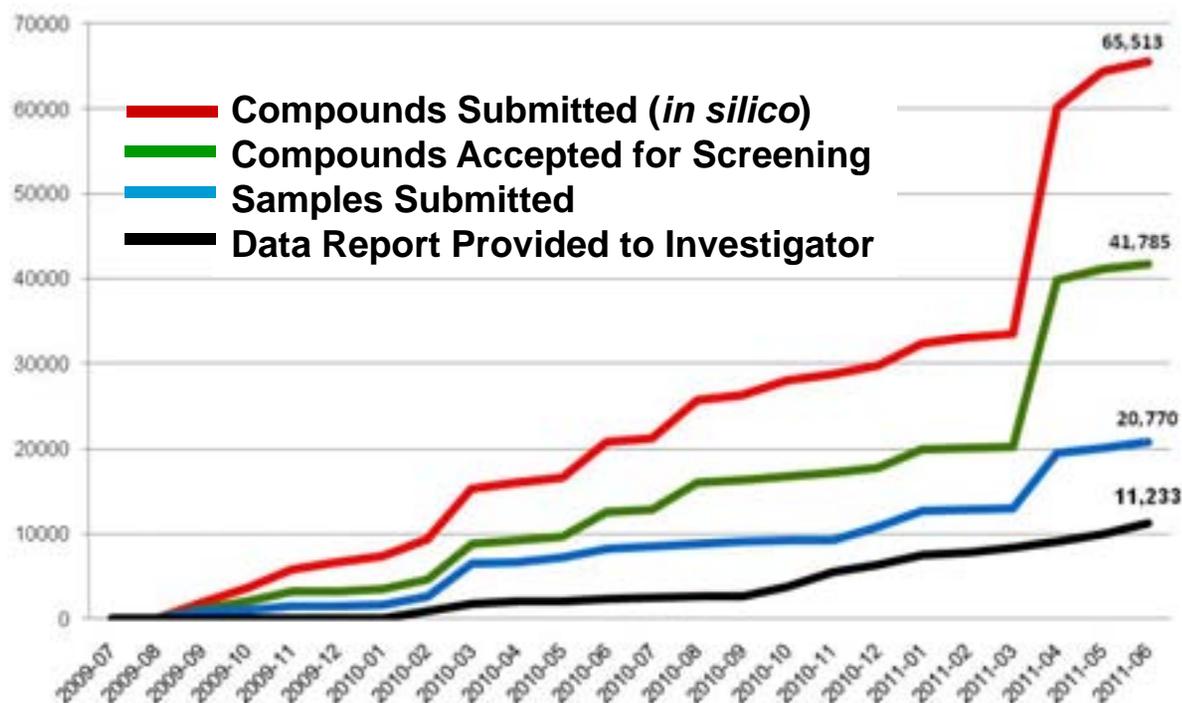

252 Affiliations in 27 Countries:

- 174 Research Universities and Institutes
- 78 Small Biotechs

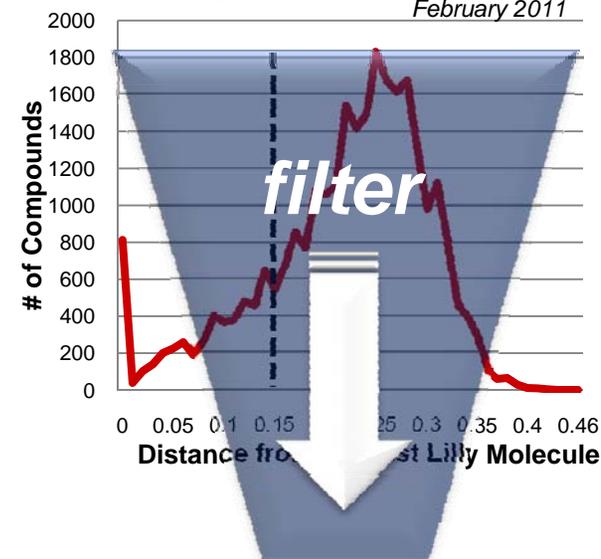

Cumulative PD² Structure & Sample Metrics

Compound Activity Evolution

PD² Compound Diversity Analysis

February 2011

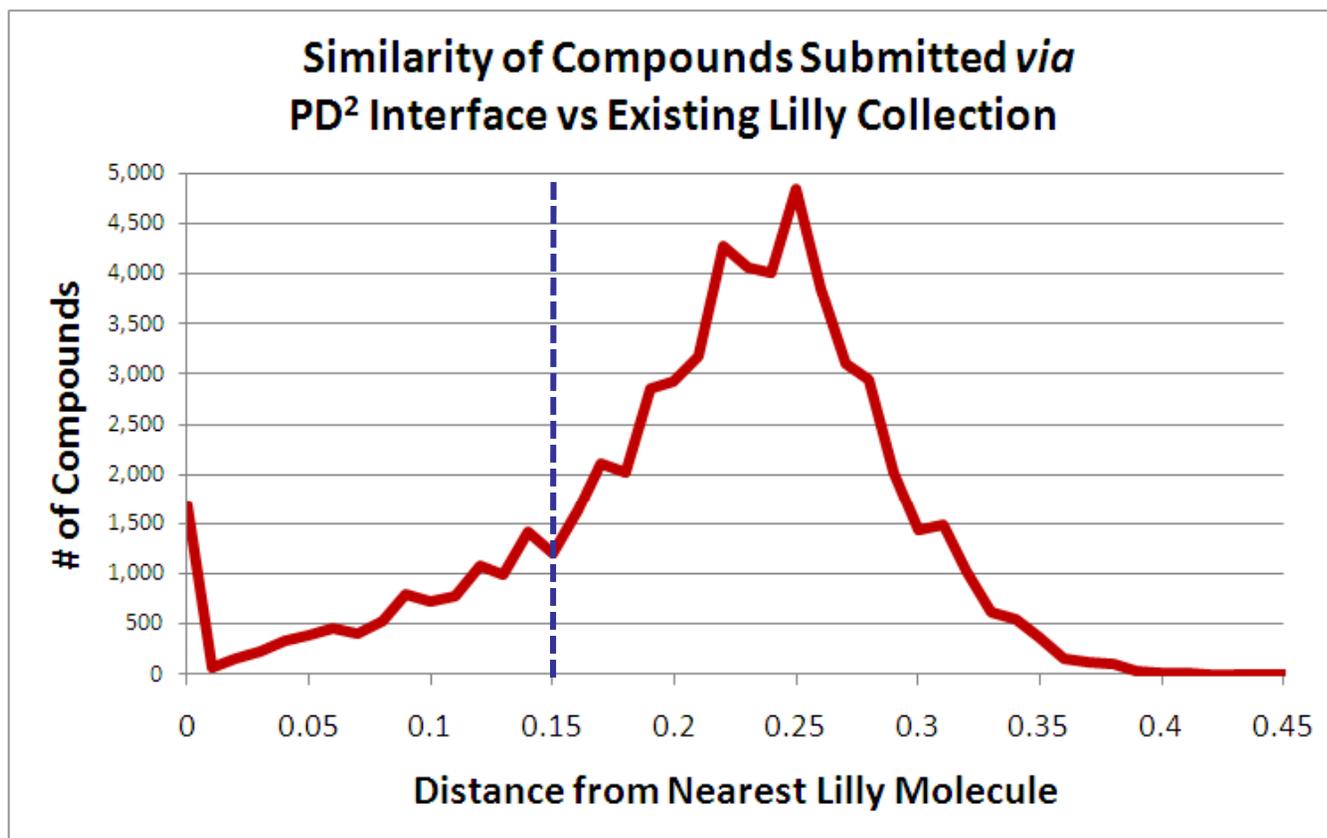

~60% of Compounds Accepted for Screening

Exclusion:

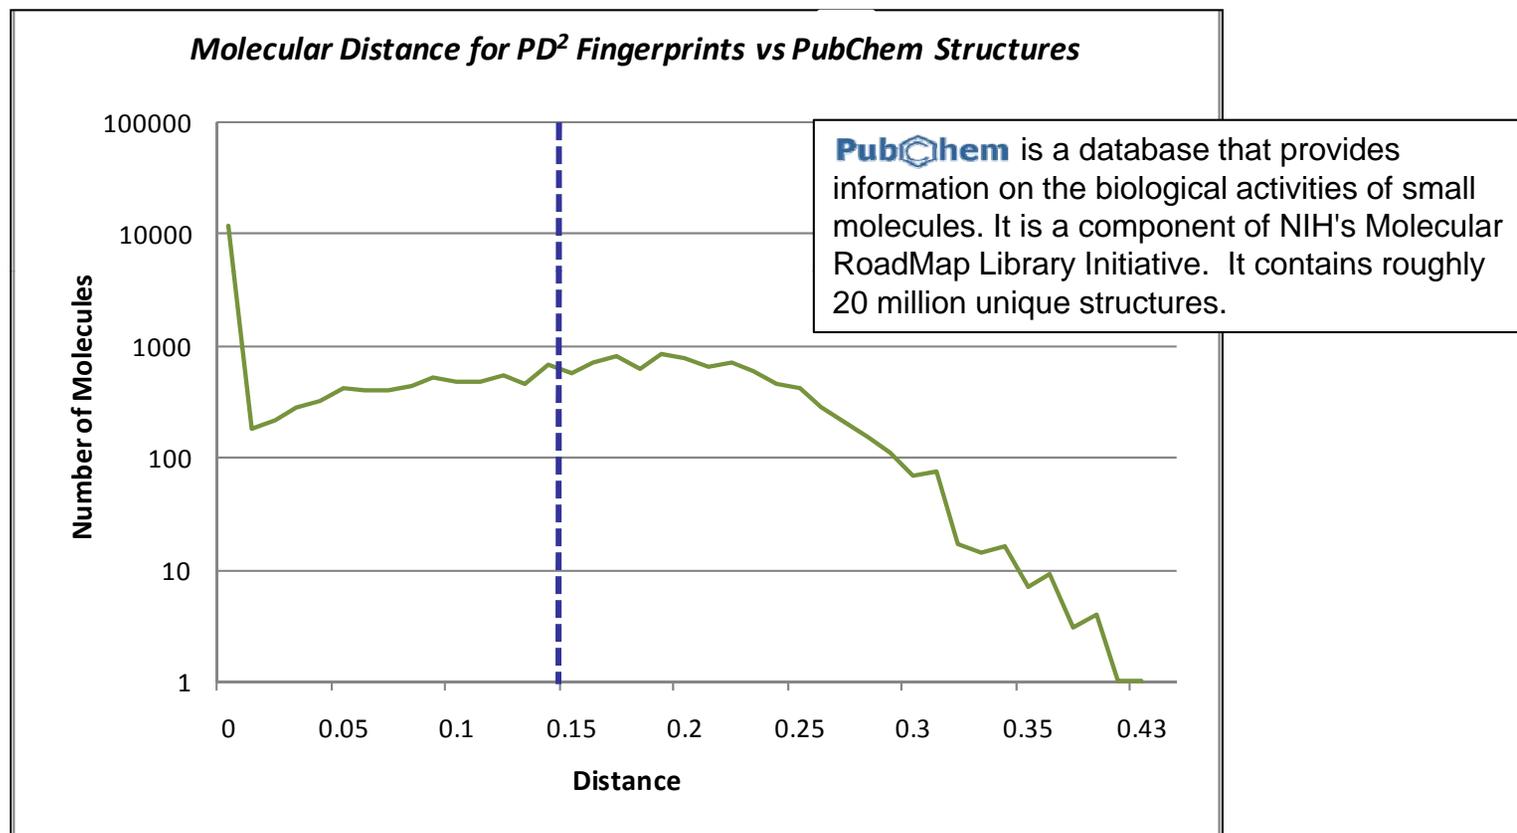

- Fail Med Chem Rules
- Insufficient Novelty
- Similar to Tested Compounds
- Similar to Controlled Substances

Structural Diversity of PD² relative to the Lilly Compound Collection

PD² collection to date offers compounds with structural diversity relative to the Lilly Collection

Structural Diversity of PD² relative to the PubChem Collection

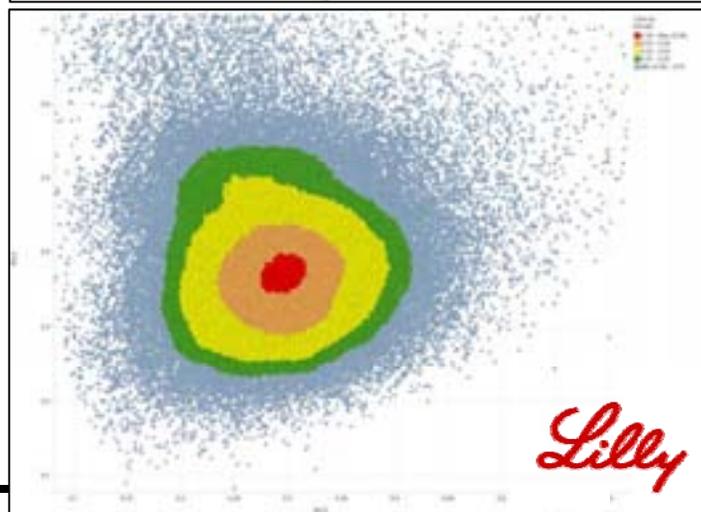

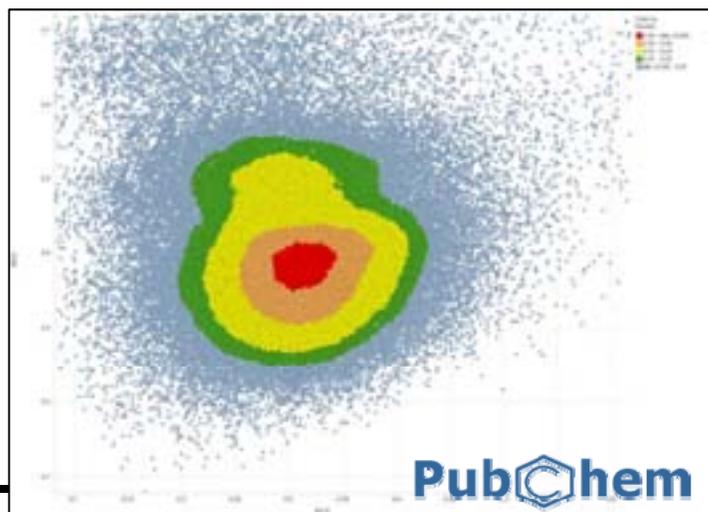

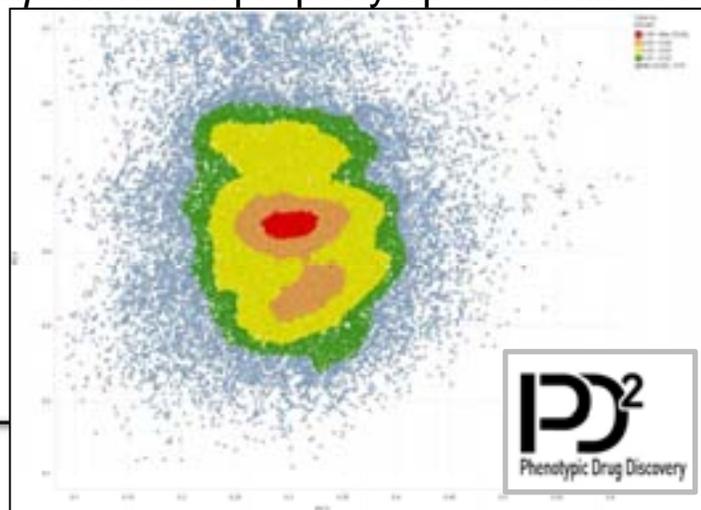

Many molecules are similar to those in PubChem, but a large proportion are significantly (> 0.15) different.

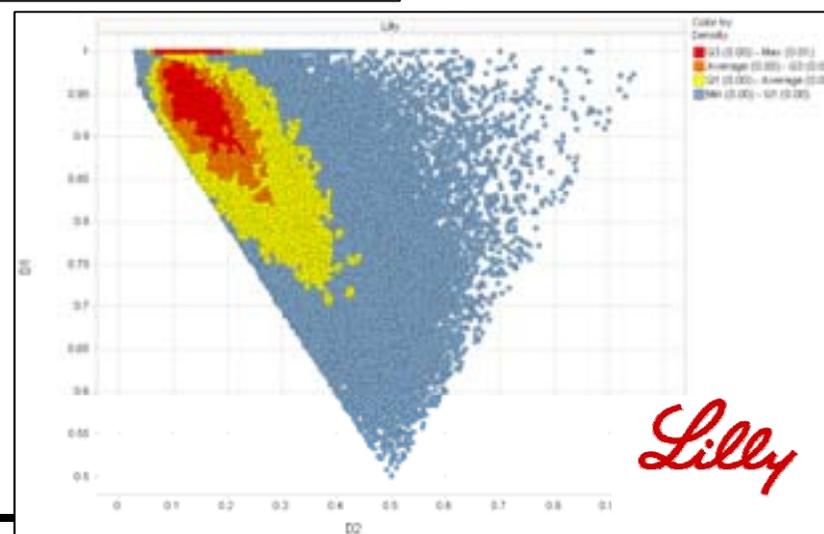

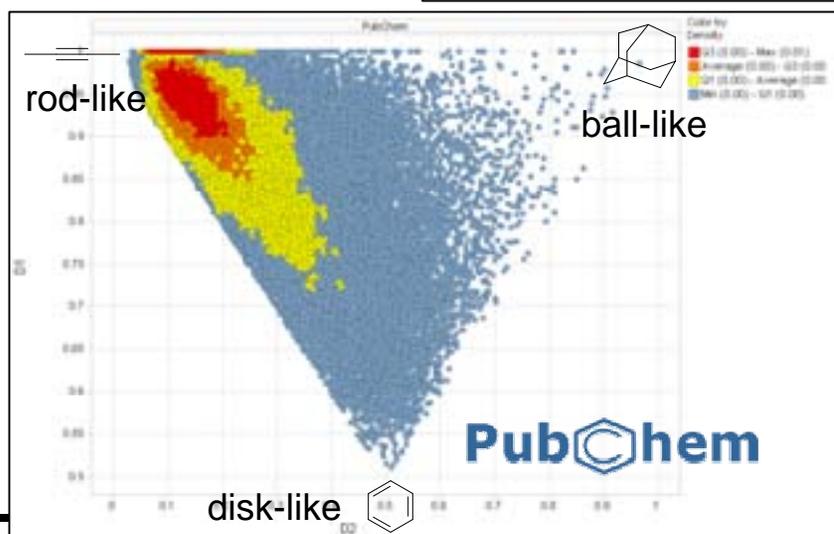

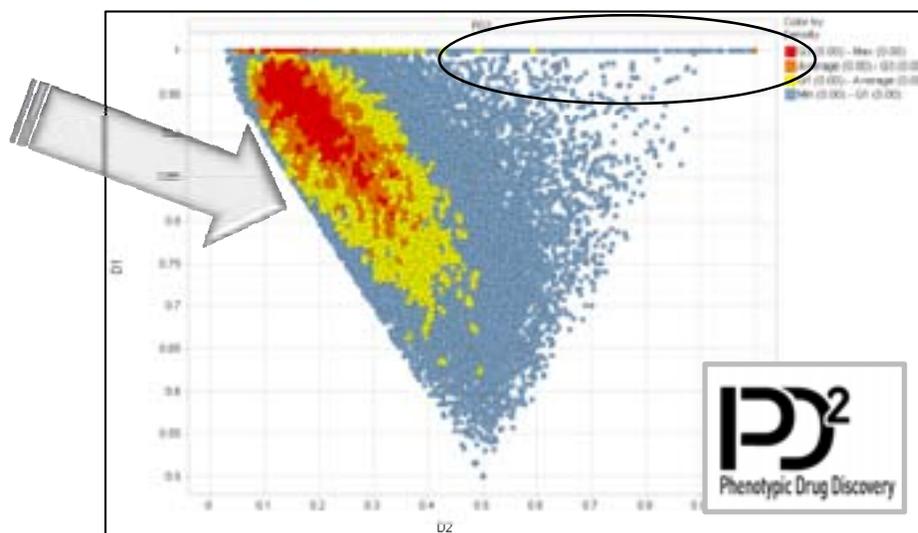

Property Space Comparisons Among Alternative Diversity Sources

Projection of collections on the *first two principal components* of property space defined by:

- Molecular weight
- clogD at pH7.4
- Aromatic density
- Fraction of SP₃ atoms
- Hydrogen bond donor and acceptor

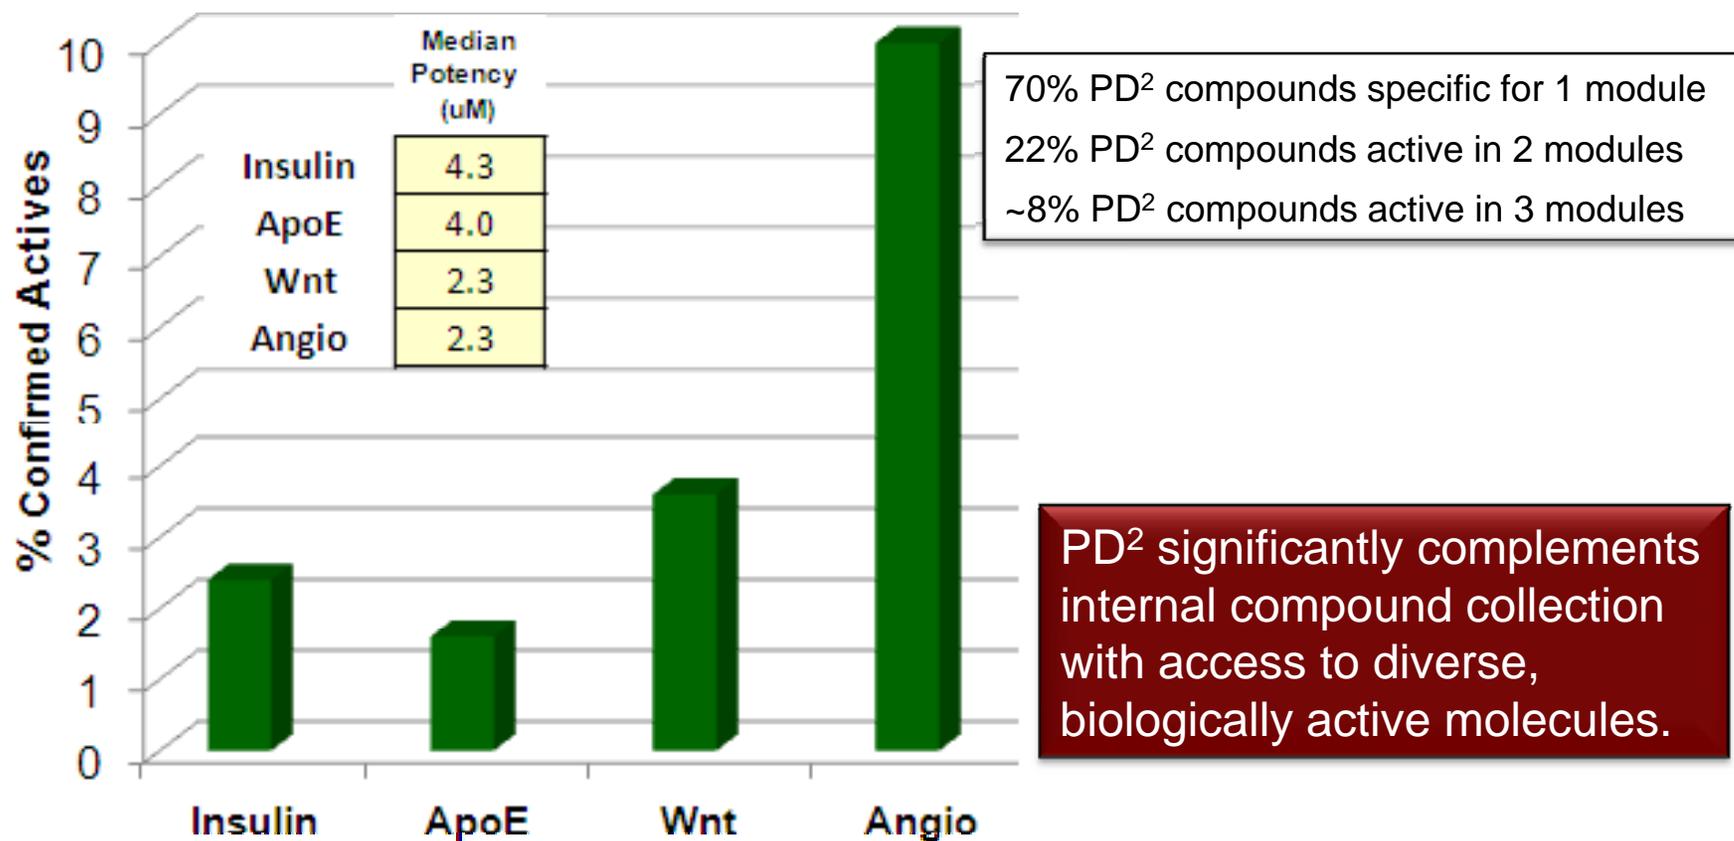

Shape Diversity Comparisons

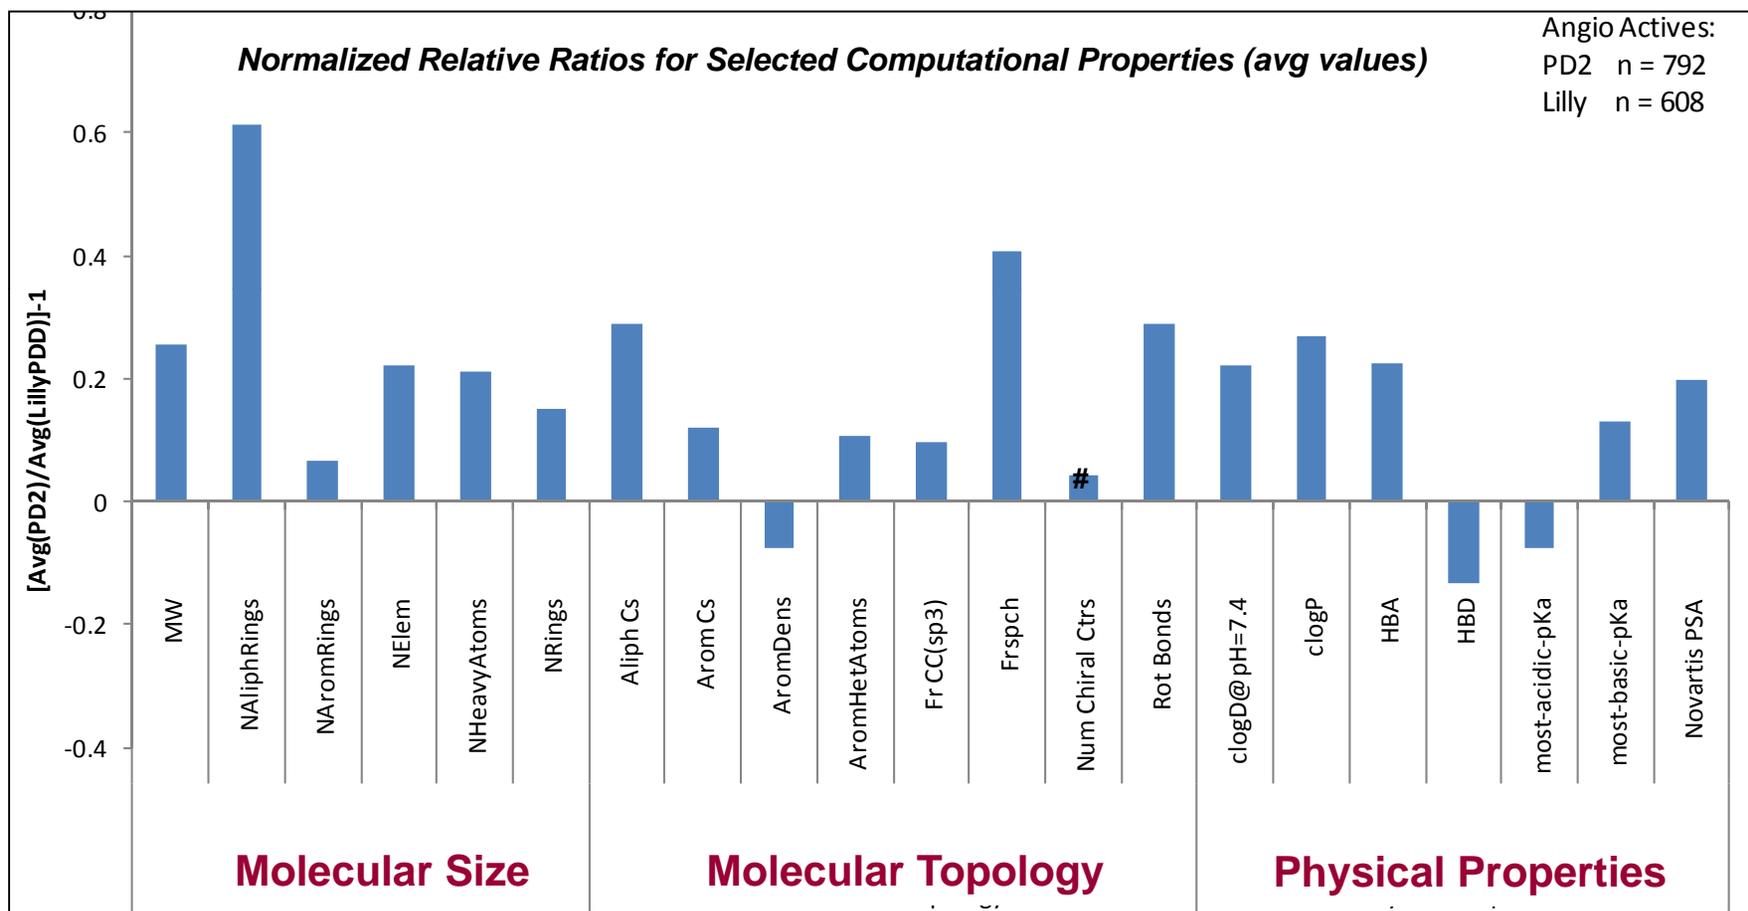

PD² Screening Metrics

Primary Assay Module Hit Rates *First 5,000 compounds*

PD² vs Lilly Project Actives Comparison

**All bars represent statistically significant deltas excepting those marked with the symbol #*

PD² Opportunity Evaluation Process

Based on screening results to date:

- 115 structures requested for disclosure
 - 97 structures shared with Lilly for evaluation
 - 91 structures evaluated
 - 13 “Yes” (6 scaffolds)

- 2 signed collaborations
- 1 in final negotiations
- 2 in early discussions
- 1 targeted for joint publication

Details available online:

- Launch & Implementation of the PD² Initiative

II. PD² Metrics and Outcomes to Date

- Institutions, Users & Compound Diversity
- PD² Collaborations

III. Open Innovation Framework/Business Model

- PD² plus TargetD² & Computational models
- Lilly TB Drug Discovery Initiative

IV. What's Happening & What's Next

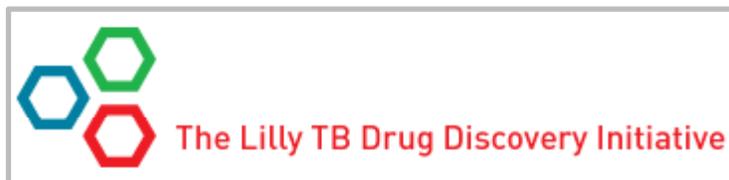

Open Innovation Drug Discovery Program and Website

To provide LRL with access to novel small-molecules that influence biological targets or pathways of therapeutic area interest

The screenshot shows the homepage of the Open Innovation Drug Discovery program. At the top, it features the program's logo and navigation links. Below the header, a main banner reads "Connecting Compounds to Patients" and lists three initiatives: "Lilly Phenotypic Drug Discovery Initiative (PD²)", "Lilly Target Drug Discovery Initiative (TargetD²)", and "Lilly TB Drug Discovery Initiative". The main content is organized into five columns: "ABOUT Open Innovation", "THE SCIENCE of Open Innovation", "GETTING Started", "EVALUATING Compounds", and "PARTNERING In Drug Discovery". Each column contains a brief description of the process and a "Read more" link. At the bottom of the page, there are five blue circular icons corresponding to the columns.

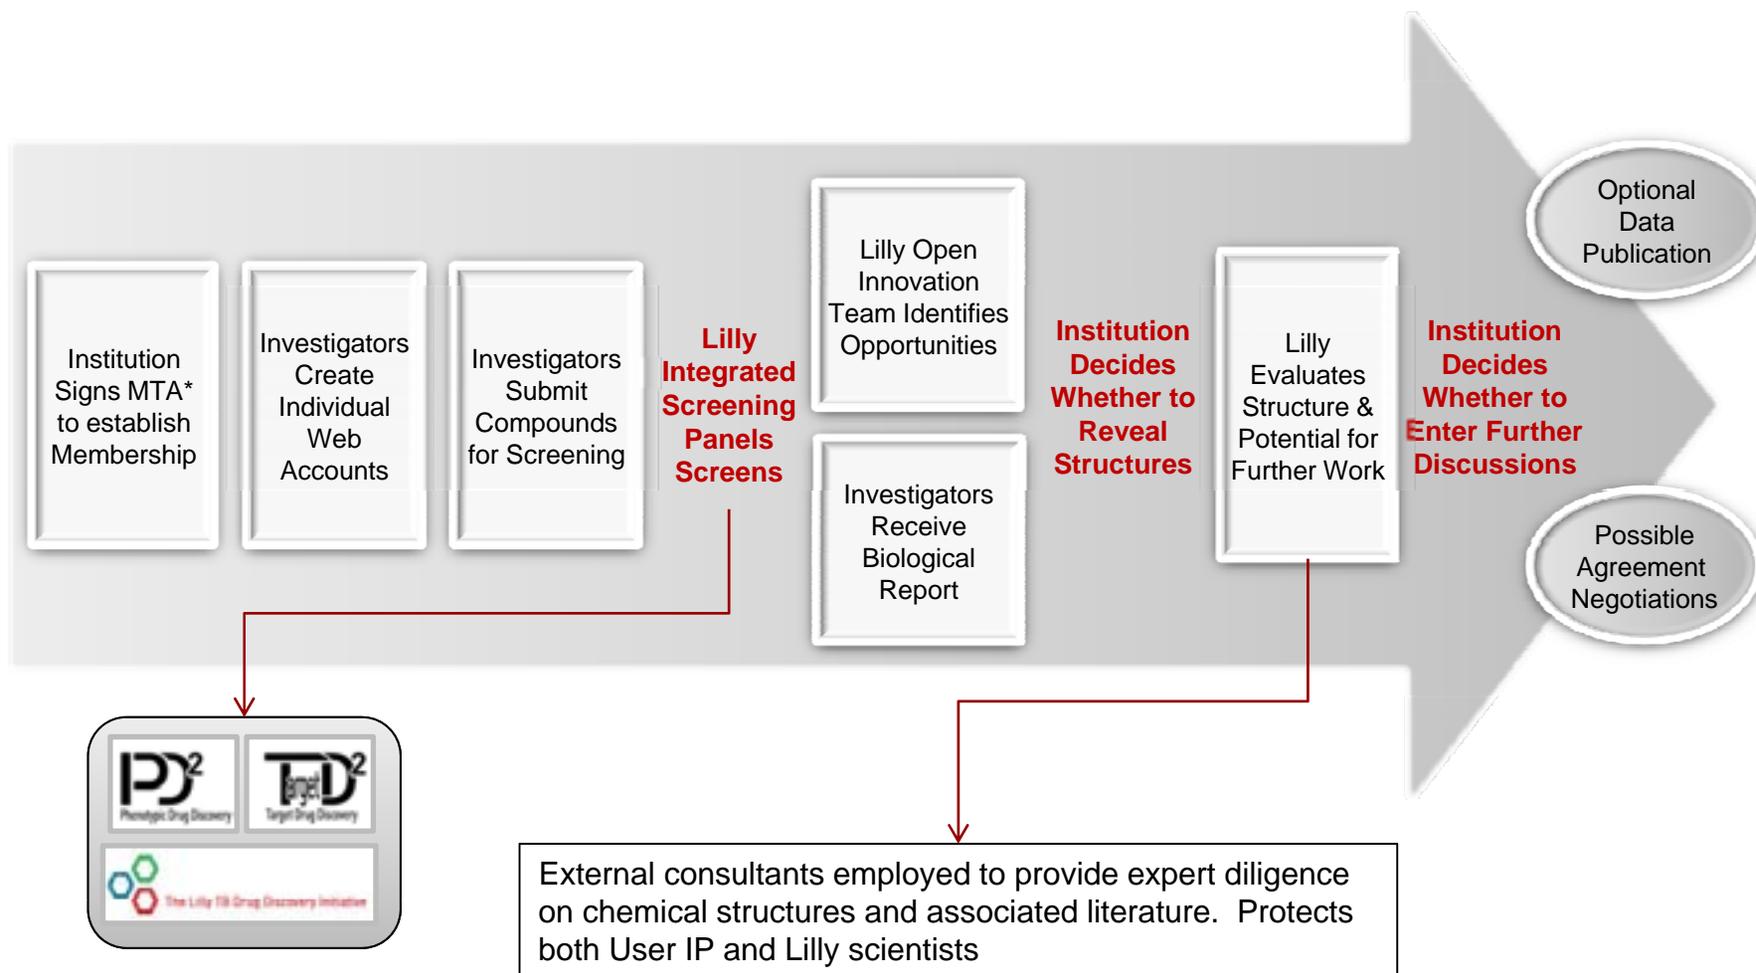

Governed through a universal MTA and affiliation process

openinnovation.lilly.com/dd

Open Innovation Drug Discovery

Integrated Business Process

What are we Looking For?

Phenotypic Drug Discovery Initiative, PD²

- compounds representing unique MOAs and differentiated profiles
- potential for SAR optimization and IP tool compounds for pathway/target(s) identification through profiling and chemoproteomic approaches
- compounds found to be active against known targets of interest
- compounds that may be hits for desired polypharmacology profiles

Target Drug Discovery, TargetD²

- compounds active against specific targets where we have failed with our internal lead generation approaches, or
- where it is desirable to have additional chemotypes (IP, tox risk, etc,) in emerging areas with no prior experience
- assay panel will be very dynamic and responsive to internal program needs

Lilly TB Drug Discovery Initiative

- compounds active in TB screens and made available to the not-for-profit initiative

Additional outcomes from relationships created with investigators, universities and small biotechs (new science, technologies, capabilities)

Open Innovation Drug Discovery

Available Assay Panels

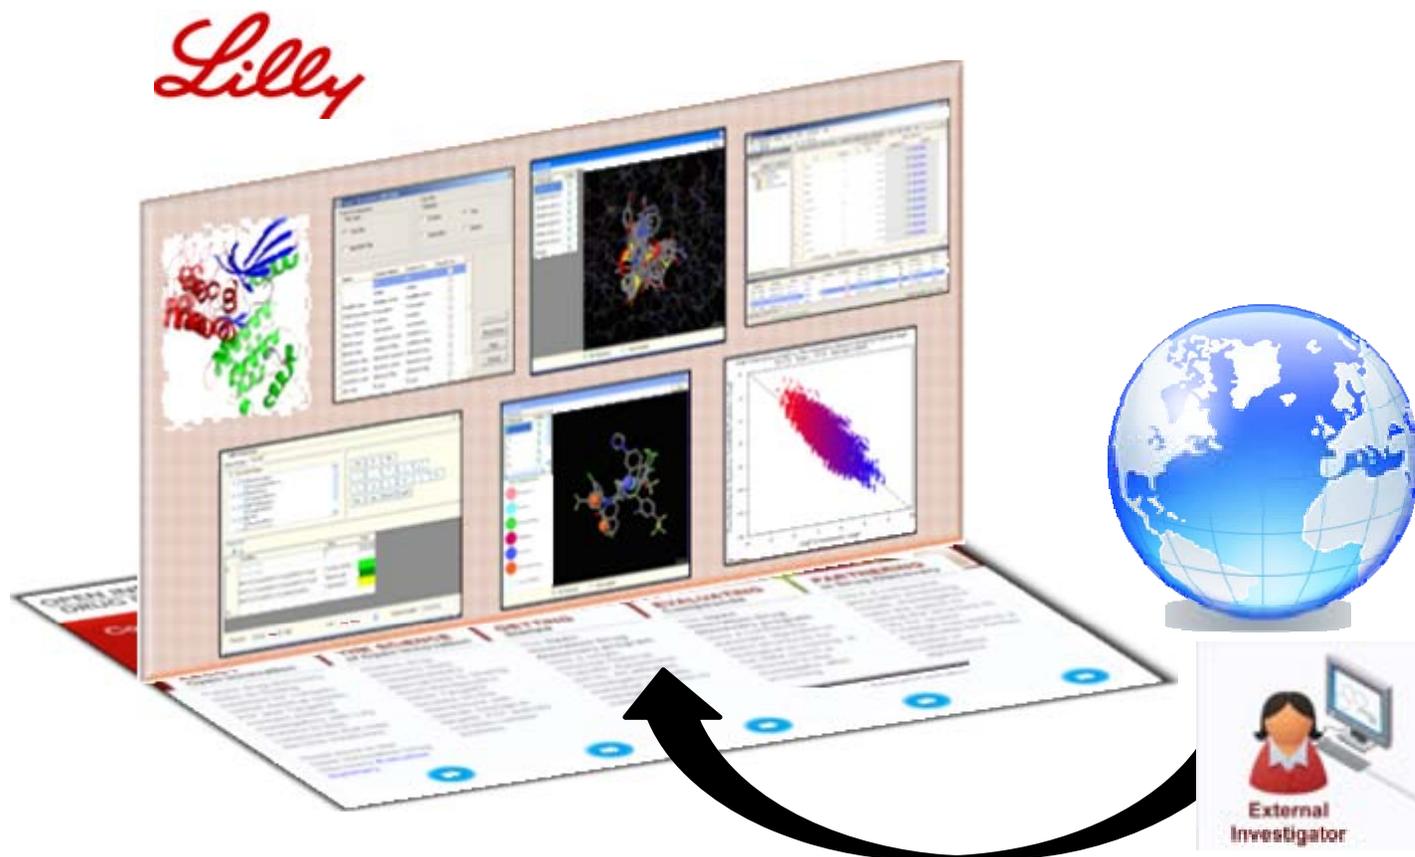

Discovery Approach	Endocrine/ Cardiovascular	Oncology	Neuroscience	Tuberculosis
 <p>Phenotypic Drug Discovery</p>	<ul style="list-style-type: none"> • Insulin Secretion • Wnt Pathway Activator • GLP-1 Secretion 	<ul style="list-style-type: none"> • Anti-Angiogenesis • K-ras/Wnt Synthetic Lethal 		<ul style="list-style-type: none"> • TB Screening Module (IDRI)
 <p>Target Drug Discovery</p>	<ul style="list-style-type: none"> • GPR119 Receptor Agonist • Apelin (APJ) Receptor Agonist • Sodium Phosphate Transporter 2b (NTP) Inhibitor 	<ul style="list-style-type: none"> • Hexokinase 2 (HK2) Inhibitor 	<ul style="list-style-type: none"> • mGlu2R Allosteric Antagonist • CGRP Receptor Antagonist

Target Drug Discovery (TargetD²)

Computational tools provided to aid compound design and selection

Protection of Chemical Structures

Presentation Overview

I. Origin of the Concept

- Chemical Diversity Strategy
- Launch & Implementation of the PD² Initiative

II. PD² Metrics and Outcomes to Date

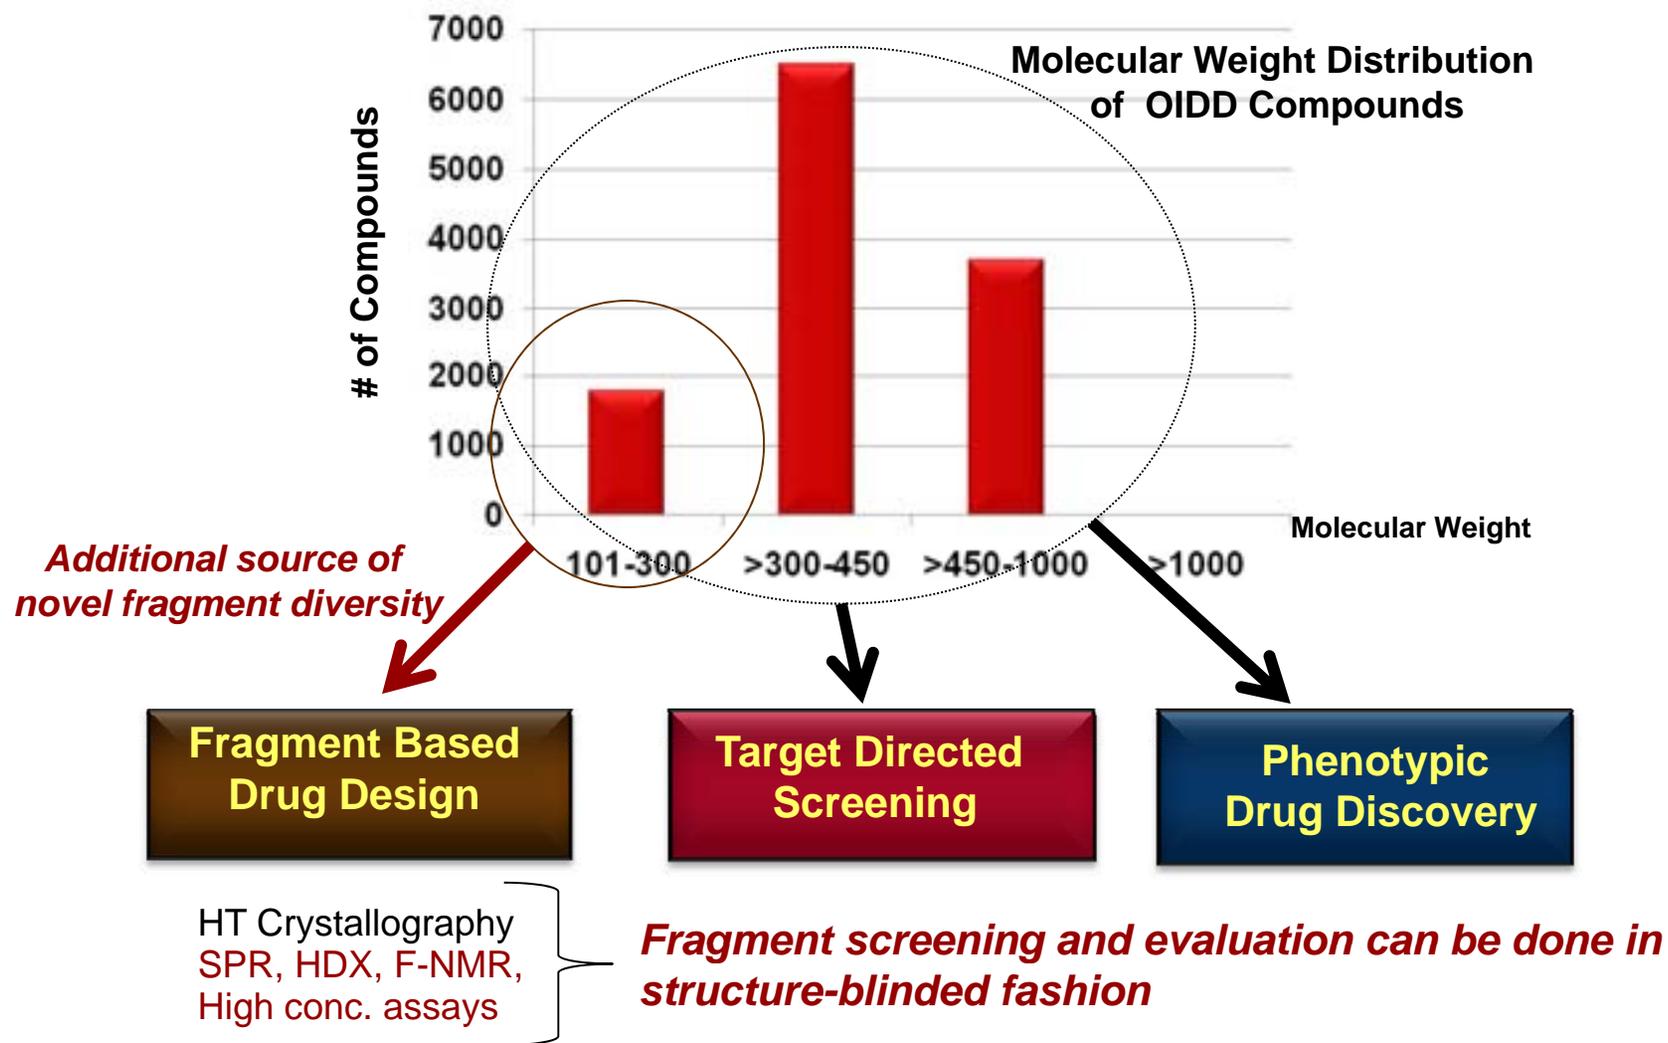

- Institutions, Users & Compound Diversity
- PD² Collaborations

III. Open Innovation Framework/Business Model

- PD² plus TargetD² & Computational models
- Lilly TB Drug Discovery Initiative

IV. What's Happening & What's Next

Additional Scientific Directions to Provide Value to Participants

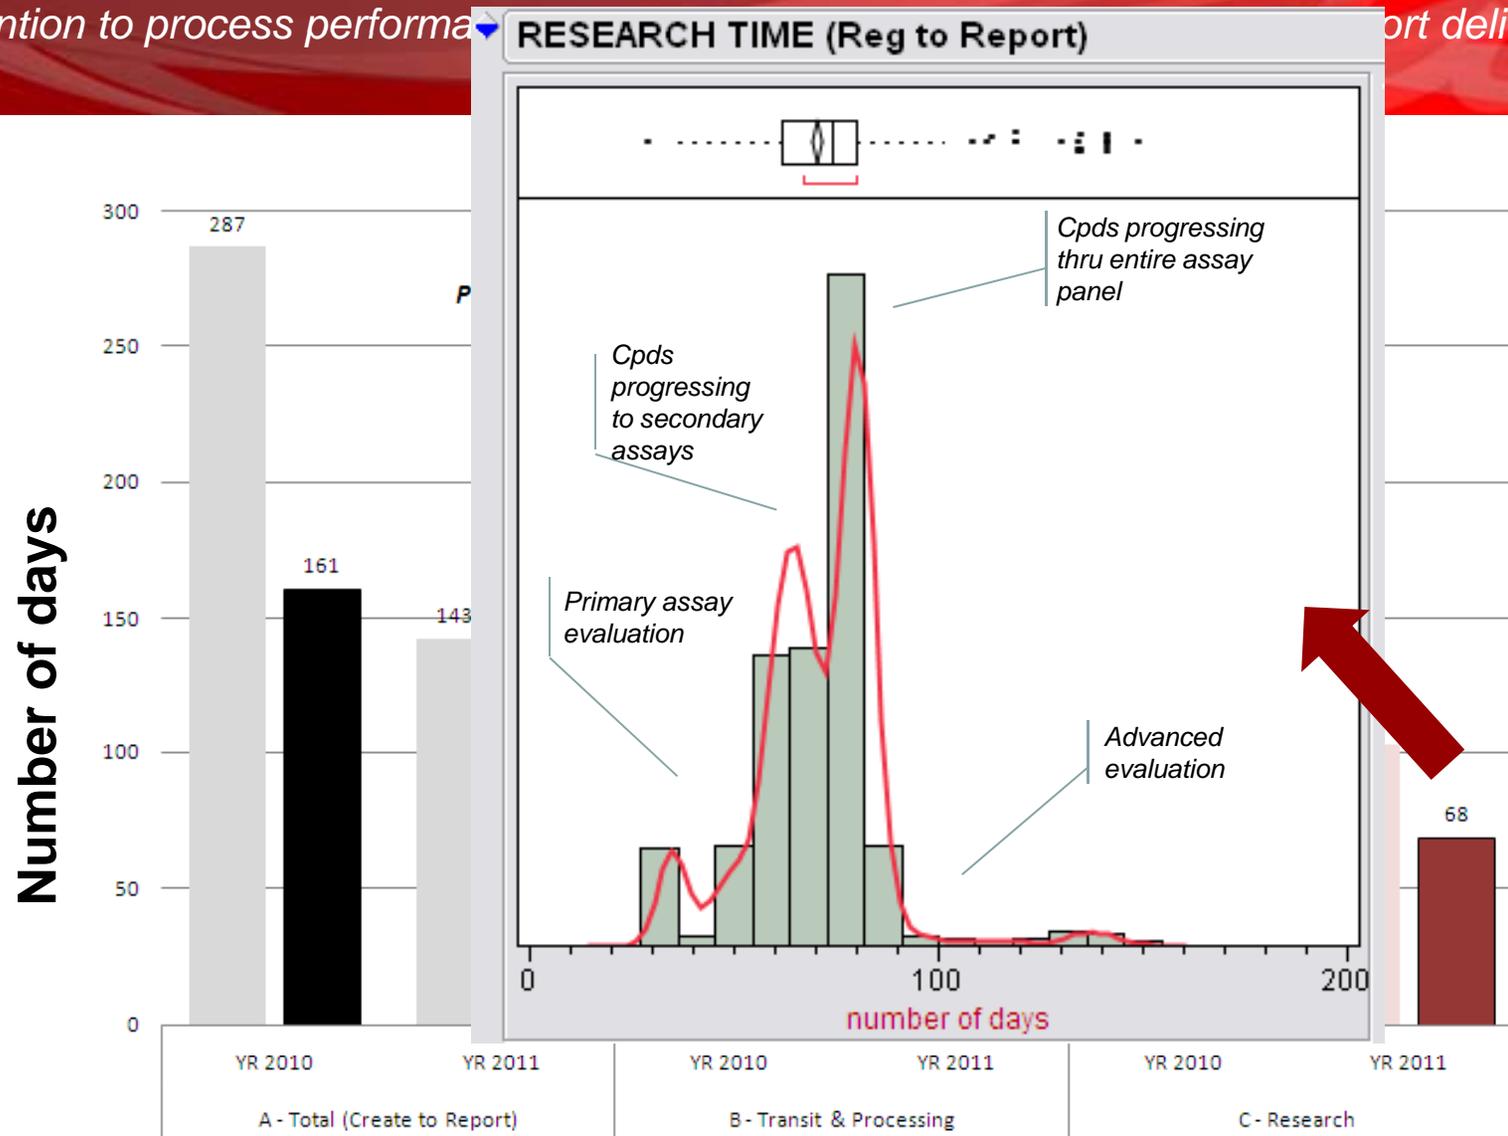

Ongoing Activity

- **13 September 2011:** new OIDD website-based application available to all users worldwide
 - **30 September 2011:** first-generation PD² Material Transfer Agreement terminated and replaced by integrated OIDD MTA
 - **Late 2011/Early 2012:** first Structure-Property models available online
 - **During 2012:** enablement of Structure-Activity models and other scientific tools
 - **Commitment to timely delivery, crisp decision-making and continuous process improvement throughout entire cycle**
-

Our Commitment to Participants

attention to process performance

report delivery

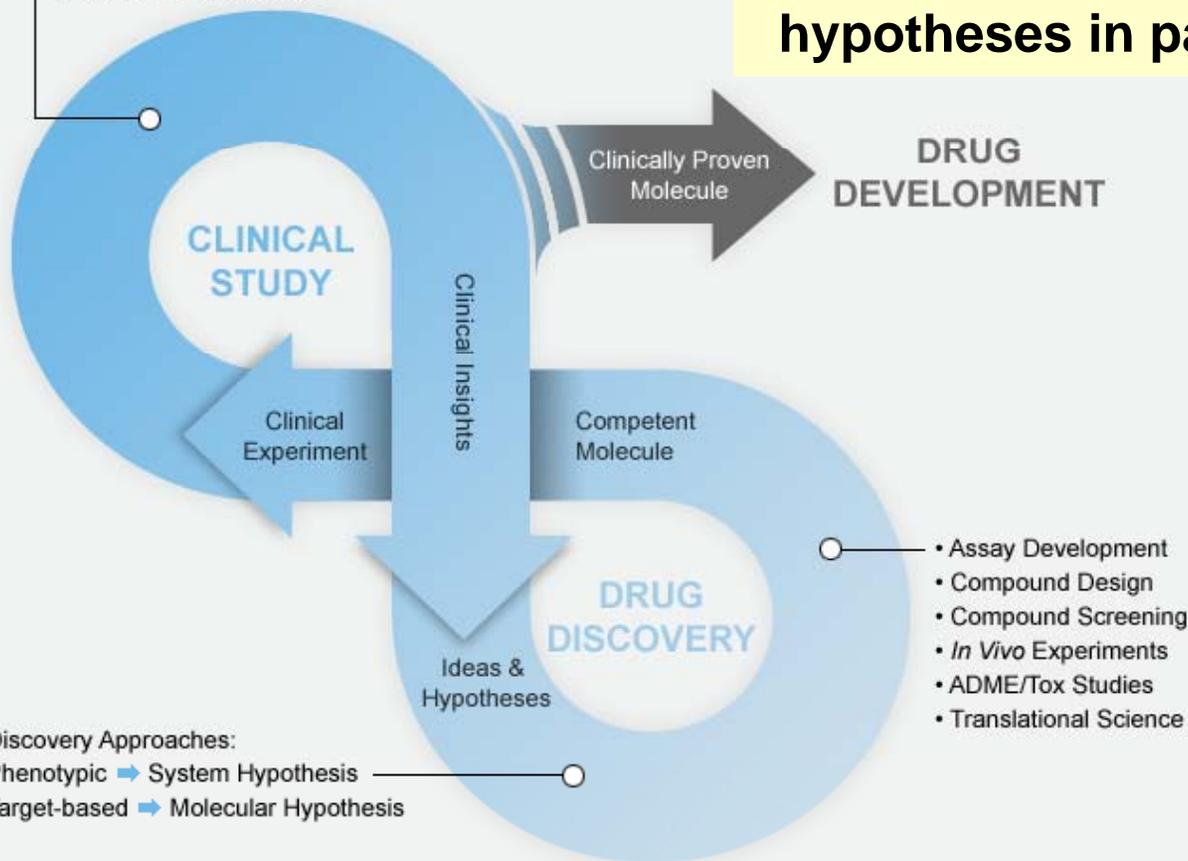

Enhancing Small Molecule Innovation

Learning Cycles in Drug Discovery & Development

- Clinical Assessment:
- Phase I: Safety
 - Phase II: Efficacy
 - Phase III: Registration

“Providing high quality molecules to test clinical hypotheses in patients”

Open Innovation Drug Discovery Design Challenges

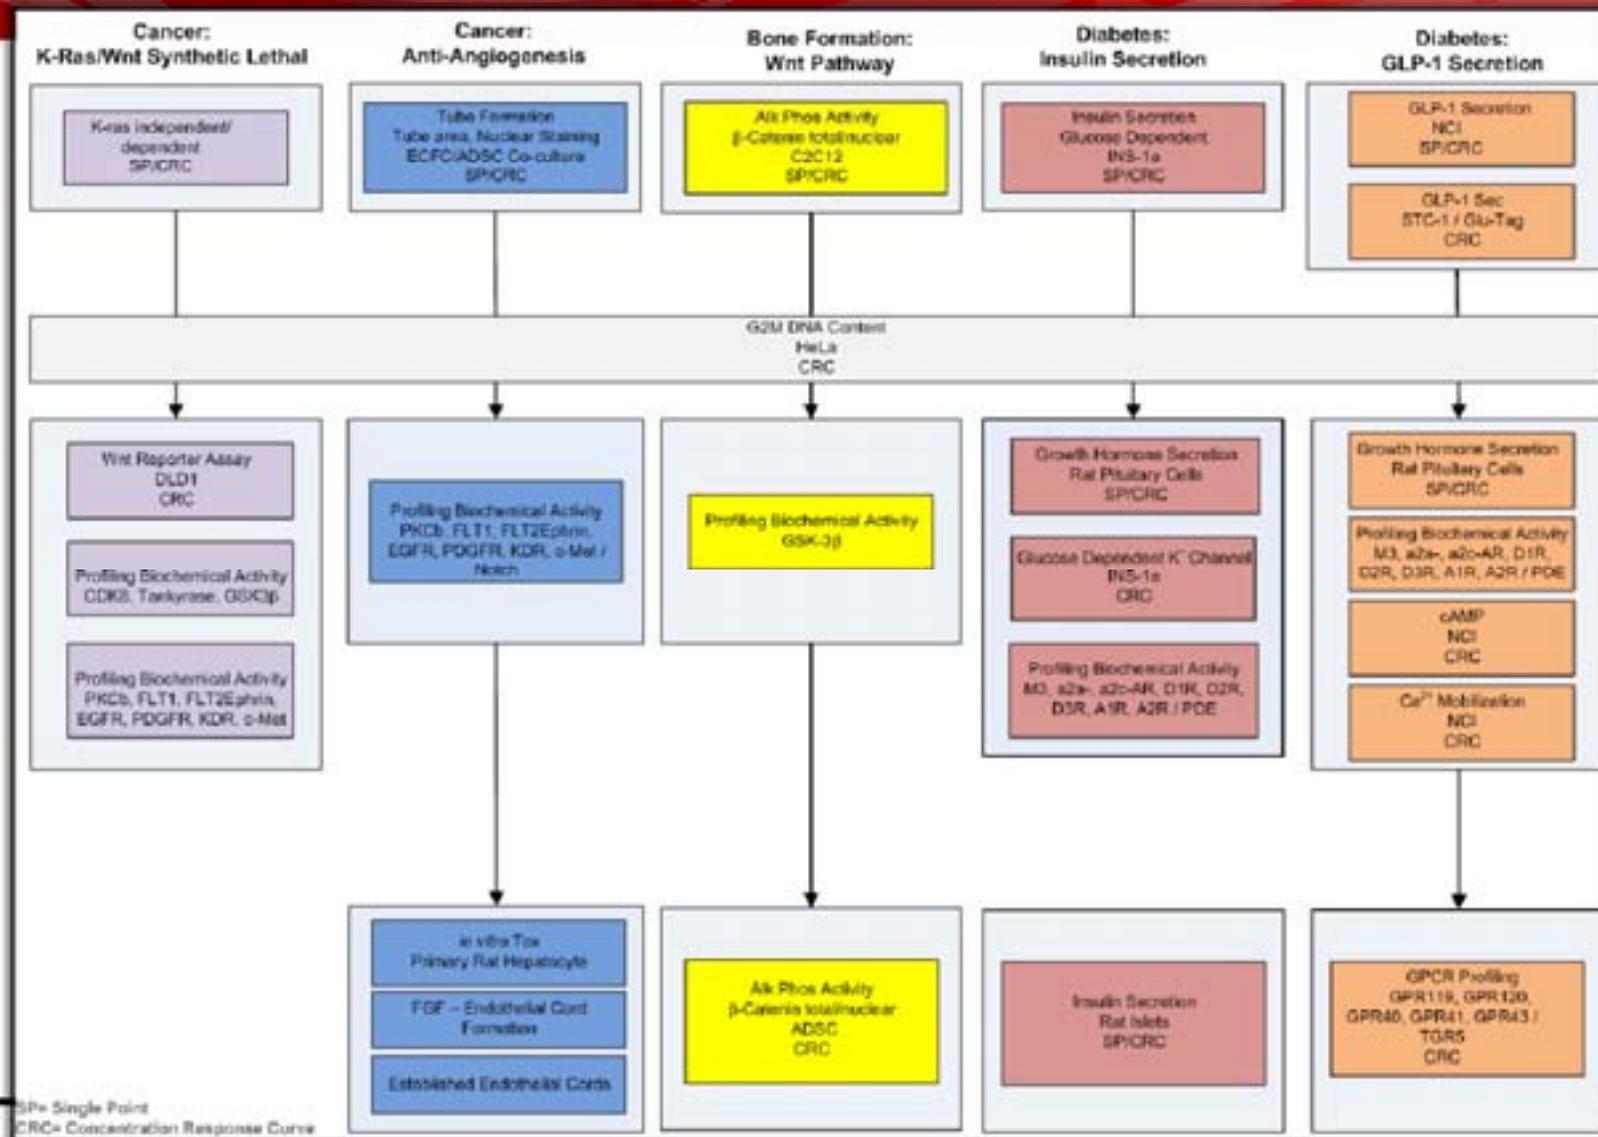

Foundational

- Business model and universal MTA design
- Building trust
- IP ownership
- Biological data as up-front transactional currency
- Confidentiality of chemical structures
- Ability for academics to publish
- Compliance and consistency

Operational

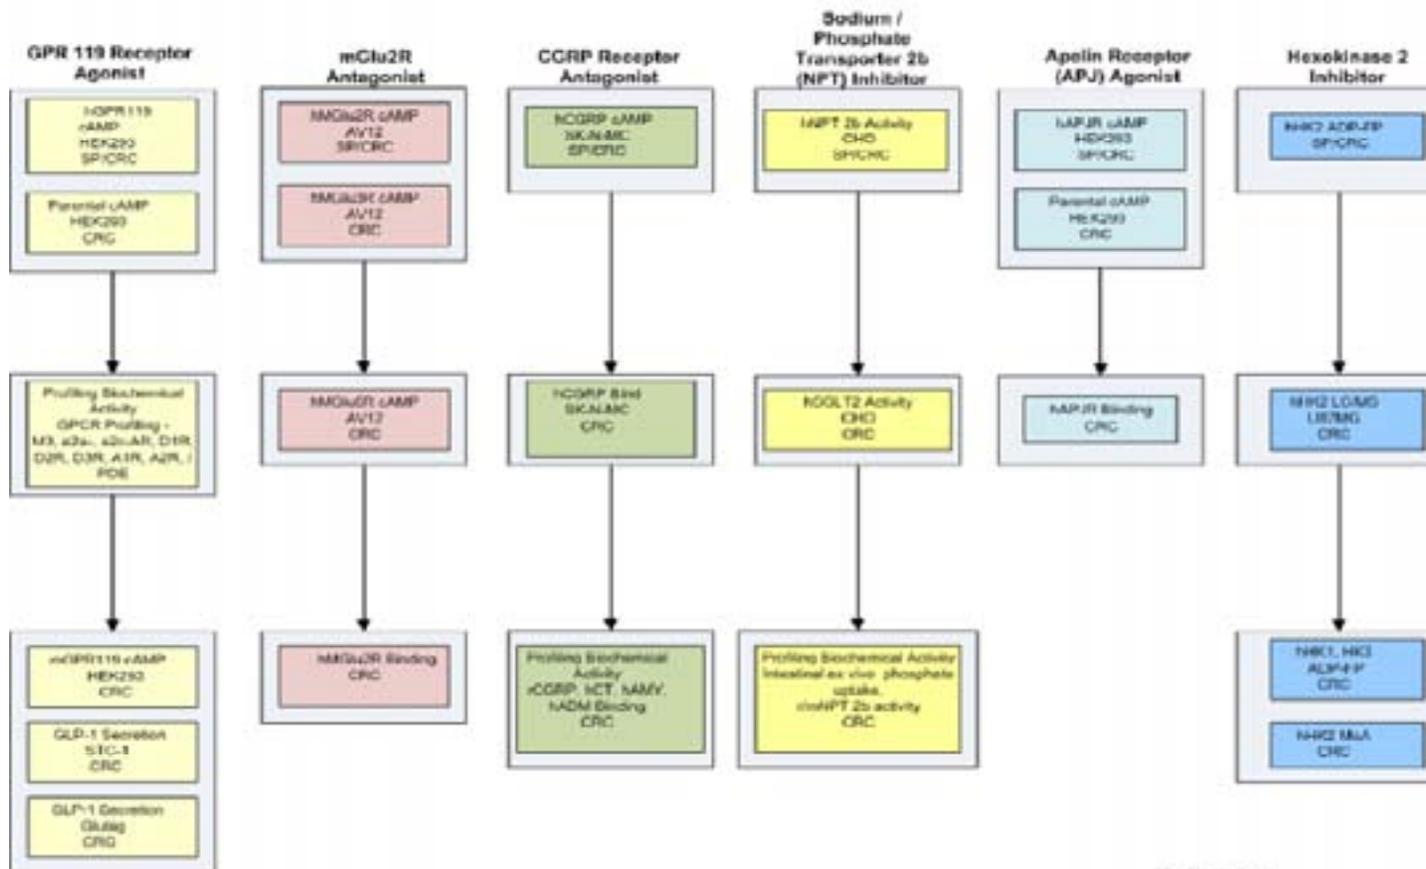

- Website design and enablement within Lilly
 - Managing multiple partnerships across the globe
 - Compound logistics
 - Timely data turnaround and communication
 - Crisp internal decision-making
-

CRC= Concentration Response Curve

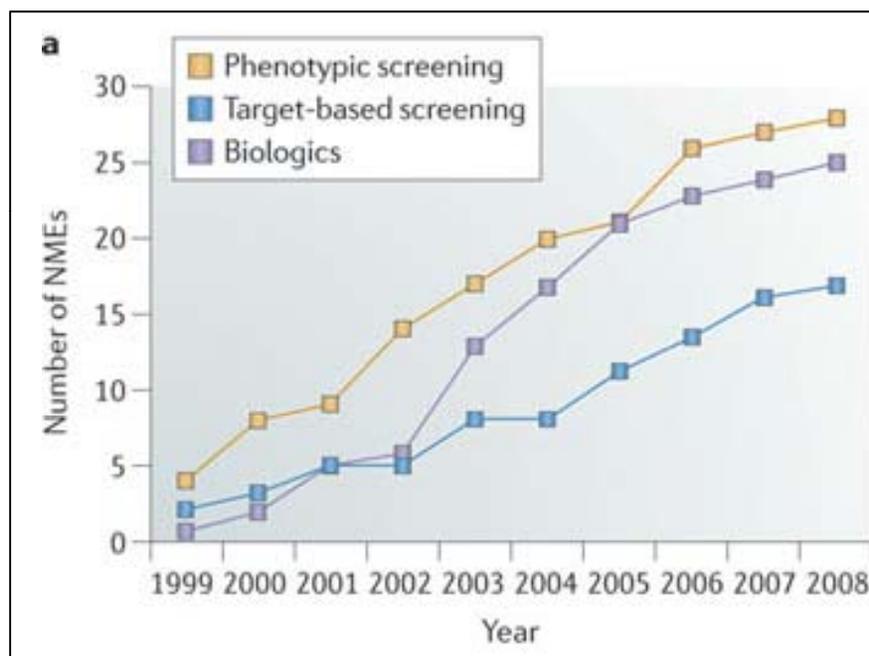

Flow Scheme & Assay Measures for TB Module

How were new medicines discovered?

David C. Swinney & Jason Anthony, *Nature Reviews Drug Discovery* 10, 507-519 (July 2011)

First in Class

Follow-on Drugs

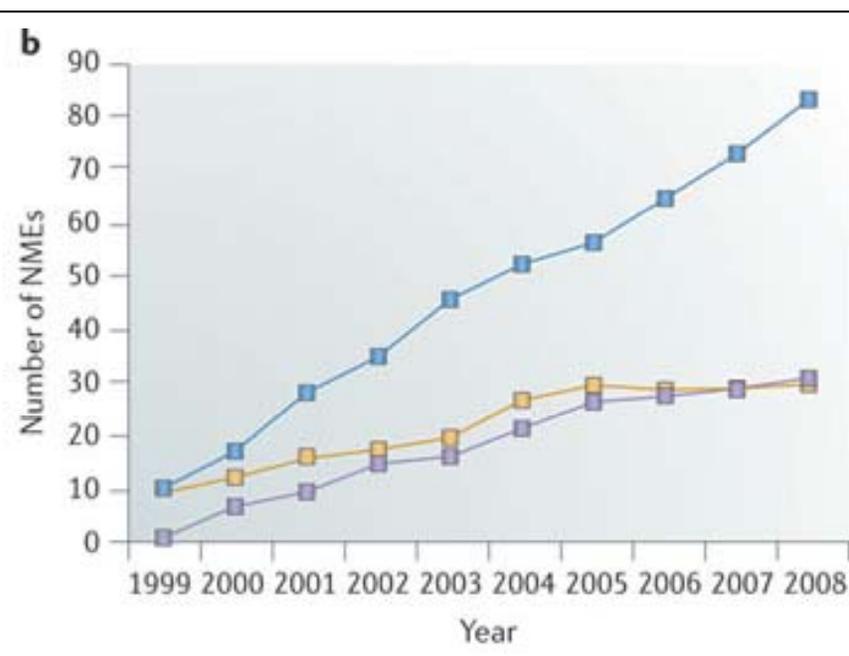

Fig 3: Cumulative distribution of new drugs by discovery strategy

- First-in-class drugs: lag is not strongly apparent in a comparison of the cumulative number of small-molecule new molecular entities (NMEs) that were discovered from the different approaches during the period analyzed
- Follow-on drugs: ratio of small-molecule NMEs discovered through target-based screening to those discovered through phenotypic screening appears to increase in the second half of the time period

Debating Value & Quality of Published Target Validation Studies

How Many New Drug Targets Aren't Even Real?

Posted by Derek

So, are half the interesting new results in the medical/biology/med-chem literature impossible to reproduce? I linked earlier this year to an informal estimate from venture capitalist Bruce Booth, who said that this was his (and others') experience in the business. Now comes a new study from Bayer Pharmaceuticals that helps put some backing behind those numbers.

“ To mitigate some of the risks of such investments ultimately being wasted, most pharmaceutical companies run in-house target validation programmes. However, validation projects that were started in our company based on exciting published data have often resulted in disillusionment when key data could not be reproduced. Talking to scientists, both in academia and in industry, there seems to be a general impression that many results that are published are hard to reproduce. However, there is an imbalance between this apparently widespread impression and its public recognition. ...

News and Analysis

Nature Reviews Drug Discovery | 18, 643-644 (September 2011) | doi:10.1038/nrd3748

Reliability of 'new drug target' claims called into question

Ashley Hulland

Bayer halts nearly two-thirds of its target-validation projects because in-house experimental findings fail to match up with published literature claims, finds a first-of-a-kind analysis on data irreproducibility.

An unspoken industry rule alleges that at least 50% of published studies from academic laboratories cannot be repeated in an industrial setting, write venture capitalist Bruce Booth in a recent [blog post](#). A first-of-a-kind analysis of Bayer's internal efforts to validate 'new drug target' claims now not only supports this view but suggests that 50% may be an underestimate: the company's in-house experimental data do not match literature claims in 60% of target-validation projects, leading to project discontinuation.

Our philosophy is to use all available approaches and tools at our disposal, and share those with our participants globally in order to help expedite Drug Discovery efforts

Open Innovation Benefits

Interview with Intuit Susan Harmon

- **Speed:** Rapid development and deployment of solutions by partnering
 - **Skills:** Complement the company's skill sets with those of partners (including suppliers), especially around technology, but also concerning *alternative business models*, customer community
 - **Focused R&D investment:** With each partner contributing its resources in the area that can be considered its core, the company can reduce spend on non-differentiating (context) functionality and can have *more innovation initiatives ongoing in parallel*
 - **New strategies require extensive partnerships:** Innovative strategies often require solutions as part of their architecture that are not available inside the company. *Partnerships can help the organization learn about a new domain at a lower cost than it would take an internal team to get up to speed*
 - **BIG disruptive ideas:** Organizations suffer from myopia and tend to fail to identify breakthrough concepts. Open innovation can *bring the diversity necessary* to identify these ideas
 - **New markets:** New markets, such as emerging markets, often have particularities different from the home market and *partnering can increase the chances of success*
-
