

PresidX Information

PresidX courses

PresidX ADMET database

Structural alerts

Contact : nigel.rogers@btconnect.com

PresidX 2-day ADMET Course, topics include

- **Pharmacokinetics: Clearance, Volume of Distribution, Bioavailability, Mean Residence Time**
- **Pharmacokinetics and Pharmacodynamics**
- **Metabolism, Distribution, Excretion**
- **Absorption, Physicochemical properties and Absorption**
- **Safety and ADME/PK: drug-drug interactions**
- **Introduction to Structure and Toxicity**
- **Receptor-based toxicities: hERG, phospholipidosis, bile salt export pump inhibitors**
- **Covalent binding and toxicity: Chemistry**
- **Minor structural changes that modify safety concerns**
- ***Workshop exercises for individuals and Teams.***

PresidX 2-day Chemical Structure and Safety Course, topics include

- **Introduction to Structure and Toxicity**
- **Toxicities that are not mediated by chemical reactivity**
- **Receptor-based toxicities: hERG, phospholipidosis, bile salt export pump inhibitors, vasculitis, non-covalent interactions with DNA**
- **Covalent binding and toxicity: rationale, chemistry, detection, examples**
- **Phototoxicity**
- **Genotoxicity**
- **Minor structural changes that modify safety concerns**
- ***Workshop exercises for Teams***

PresidX ADMET Data Base : Structure searchable database

[Available on a CD-Rom as an MDL ISIS Desktop v2.5 DataBase file, .dbf (database software not supplied). Can also be supplied as an .sdf file]

PresidX

Description.

- **The latest PresidX ADMET database (v2.0) contains concise descriptions of the Absorption, Distribution, Metabolism, Elimination and Toxicity, ADMET (including Safety Pharmacology) properties of over 1180 compounds together with chemical structure.**
- **Many records include comments on mechanism of action and structure-activity relationships in relation to ADMET, in order to aid improved drug design.**
- **For 170 compounds, selected metabolites or reactive intermediates of interest are illustrated (and structure searchable). Over 600 compounds with ADMET concerns due to reactivity are included.**
- **Learn from information on about 200 compounds withdrawn from the market or discontinued from development and compare with 450 marketed pharmaceuticals**
- **Examples of numbers of compounds with particular properties:**
 - *adverse effects on liver (>380);*
 - *blood (>180) ,*
 - *skin (>50);*
 - *enzyme inactivators (>120)*
 - *carcinogenicity (>200)*
 - *genotoxicity (>200)*
 - *P-gp inhibitors/substrates (>60)*
 - *enzyme inducers (>110)*

Data Content:

- Molecular Structure:** *chemical structure, may contain multiple structures for entries relating to metabolites*
- Compound Name:** *generic name (or an arbitrary descriptive name based on reference quoted)*
- CAS Reg Number:** *Chemical Abstract Registration Number (if located)*
- Compound Status:** *e.g. Marketed (Pharmaceuticals), Withdrawn, Discontinued, Agrochemical, Veterinary Product, Example*
- Therapeutic indication:** *where appropriate.*
- PX_number:** *unique PresidX code number*
- FW:** *formula weight*
- Main ADMET Concerns:** *uses key words or phrases e.g. liver, blood, inactivator, inducer, carcinogenicity, genotoxic. Inclusion does not imply a safety risk.*
- Structure Comment:** *key structural features and PX number of the record (if available) that illustrates metabolites.*
- ADME Comment:** *any special characteristics relating to ADME e.g. species differences, P450 inhibition, metabolic activation, metabolites, enzyme induction.*
- Clinical Safety Comment:** *focus is on adverse effects, however rare, that may be related to structural features.*
- Pre-clinical Safety Comment:** *major findings in toxicity studies, including in vitro data.*
- Mechanism of Action_ADMET:** *possible mechanisms relating to ADMET based on the literature or on comparison with structurally/biologically similar compounds, may be speculative.*
- SAR_ADMET:** *examples of compounds with similar structures & or ADMET effects.*
- Reference _1:** *only provided if CAS number not indicated above.*

Designing Safer Compounds: *The Ashby-Tennant supermolecule, structural alerts to DNA reactivity and genotoxic carcinogenicity*

Note

* di-N-oxides such as quinoxaline di-N-oxides appear to be mutagenic, possibly via reduction to reactive radicals but most simple pyridine N-oxides do not appear to be mutagenic

** ethyl carbamate is probably mutagenic via 2E1 mediated hydroxylation & formation of vinyl carbamate; most carbamates are not genotoxic unless carbamate facilitates loss of O.

Refer also to alerts on the FDA web site, www.fda.gov

For database of 1200 examples of compounds with ADMET issues, (> 500 with ADMET issues associated with reactivity) see the structure-searchable PresidX ADMET database, v 2.0

Designing Safer Compounds: *Examples of heterocyclic structures sometimes associated with toxicity or problematic P450 inhibition. Effects depend on substitution pattern, dose, disposition*

Dioxolanes – P450 MI complex

furan – furosemide, ipomeanol (but prazosin, OK)

thiophene – tienelic acid, ticlopidine (but olanzapine OK)

thiazole – thiabendazole or aminothiazole
Possible conversion to thioamides, thioureas (but famotidine OK)

Quinoxaline N-oxides - carbadox

Polyheteroaromatics, often 1A substrates – example shown

aminopyrine
easily oxidisable heterocycles
clozapine

e.g. P450 inhibition, thiazole – ritonavir
imidazole – cimetidine; also substituted imidazoles – ketoconazole, clotrimazole (but famotidine OK)

Diphenylamine in ring, e.g. carbamazepine, or not, e.g. diclofenac

Alkyl substituted indoles, pyrroles – 3-methylindole

Thiazolidinediones - troglitazone (but rosiglitazone, pioglitazone OK)

Various tricyclics that can form arene oxides or reactive imines e.g. amineptine

Quinolines when R₁ & R₂ = H (but saquinavir, R₁ = alkyl, OK)

Unsaturated piperidines, piperazines, dihydroquinolines or hydroxy precursors – MPTP, haloperido, mianserin ketoconazole

N-phenylsuccinimides – some are nephrotoxic

Radical formation – phenytoin (cf thalidomide)

Designing Safer Compounds: *Examples of mostly non-heterocyclic structures associated with toxicity or problematic P450 inhibition, most of these alerts relate to reactivity*

PresidX®

Catechols, Hydroquinones –
e.g catechol (but isoproterenol, OK)

Aldehydes or pro-drugs of,
example chlormezanone

Cyclopropylamine –
tranylcypromine,
trovafloxacin

Diaryl ketones – photosensitisers
e.g. amiodarone (mebendazole, OK)

Allyl – tamoxifen,
safrole (but droloxifene OK)

Alpha-diketones – methylglyoxal
but hindered examples OK.

Haloalkanes -
halothane

acetylenes –
P450 binding &
reactive intermediates

Valproic acid
(metabolised to dienolic acid)
Various unusual fatty acids
inhibit mitochondrial function
Cyclopropane carboxylic acid

2,5-diketones &
related compounds– 2,5-
hexanedione

o-amino or
nitrophenols –
tolcapone (but
entacapone OK)

p-aminophenols &
ethers-acetaminophen,
practolol; some p-
chlorophenols –
ochratoxin A, PCP &
some phenols
(but celiprolol, OK)

Alkyl propionic & acetic acids –
ibuprofen, indoprofen
(but ibuprofen & many other
arylpropionic acids OK)

Aryloxy carboxylic acid PPARs
(rat specific toxicity)

Thioamides & thioureas
- ethionamide, metiamide
propylthiouracil

Isocyanate liberating - sulfenofur
(note: cf. tolbutamide)

Thiol containing
(note captopril, penicillamine marketed)

Designing Safer Compounds: *Examples of alerts to skin sensitisers*

(require metabolic activation)

(acylating)

(requires autoxidation)

Designing Safer Compounds: *Examples of alerts and example compounds with phototoxicity*

(many polyaromatic hydrocarbons)

(where Y=N, O, S and X = halo; especially if Y=OH and a salicylanilide; also example where Cl m- to OH)

(especially dinitro-)

(especially where Y = N)

(where R= H or alkyl)
