# Hampshire County Council's Approach to Lifecycle Planning

Steve Spender lEng FIHE
Highway Manager HQ
Hampshire County Council

# **Today's Presentation**

- Brief history what, when, why
- New Approach to Budget Allocation
- Moving to Route Strategies
- Understanding relationships LoS, customers, condition, cost

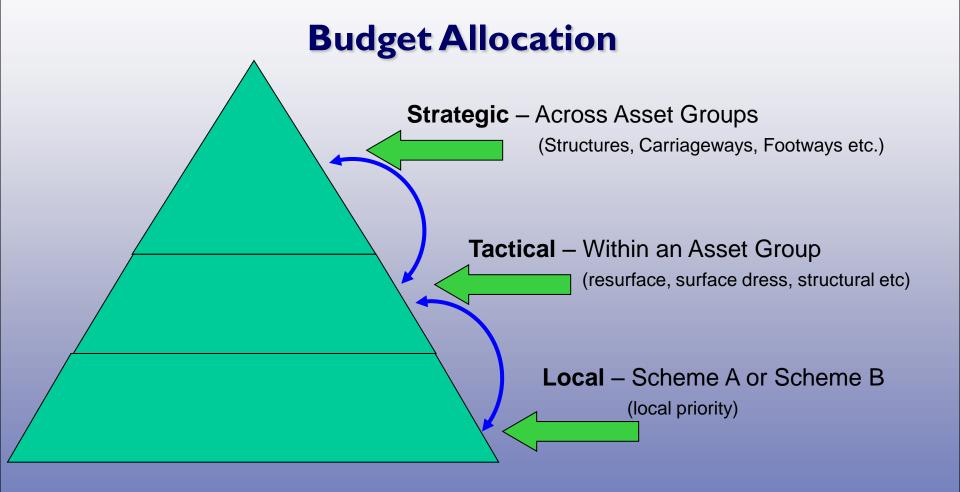

## **Brief History**

#### Management decision in 2008 to:-

- Improve budget process
- Identify strengths and weaknesses
- Examine our budget allocation processes
- Develop new processes and tools

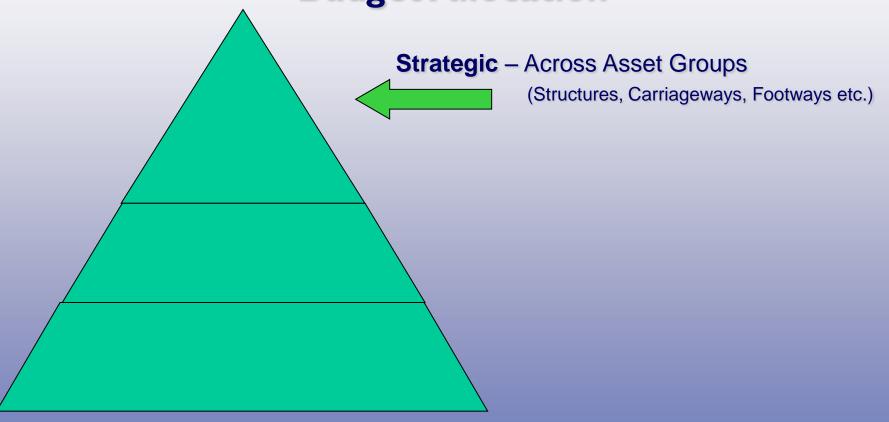

# Asset Management

# Asset Management

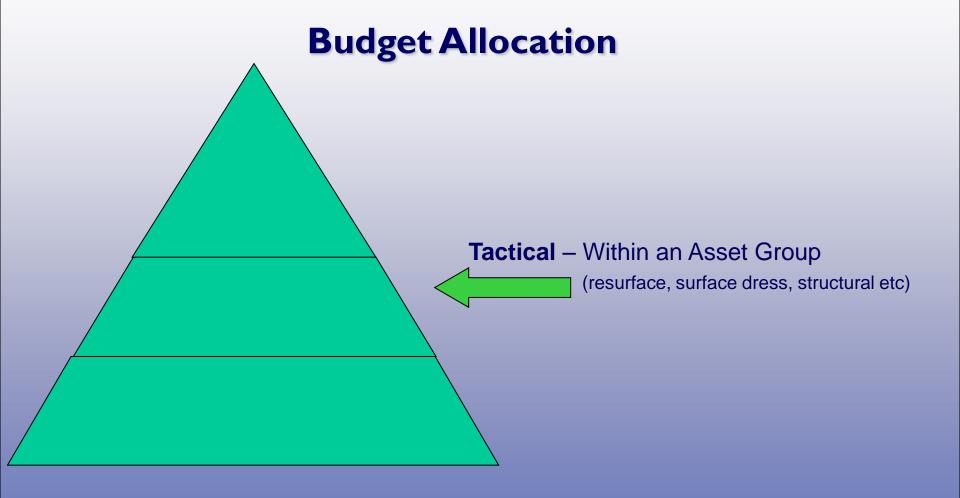

#### **Initial Review**

• Strategic (across assets) - historic allocations with limited information on why the money was allocated

# Asset Management

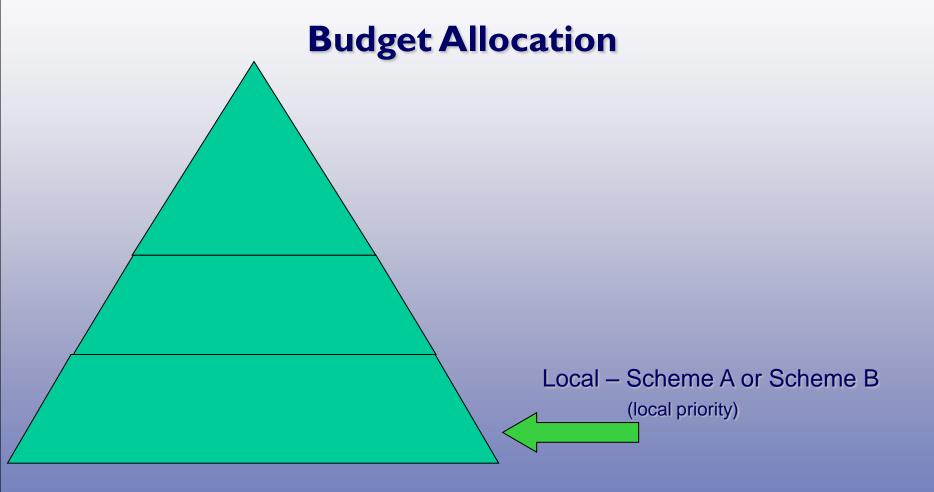

#### **Initial Review**

- Strategic (across assets)- historic allocations with limited information on why the money was allocated
- Tactical (treatment options) Some limited lifecycle planning applied, no formal approach or review processes. No budget analysis to support decisions or review of objectives.

# Asset Management

#### **Initial Review**

- Strategic (across assets) historic allocations with limited information on why the money was allocated
- Tactical (treatment options) Some limited lifecycle planning applied, no formal approach or review processes. No budget analysis to support decisions or review of objectives.
- Local (to do or not to do) Reasonably good justification and prioritisation processes, but in the main related only to condition.

## Developing the theme

#### Identified the need to develop tools that

- Relate spend and service provision to corporate values at a strategic level.
- Accommodate lifecycle planning and compare different treatment options.
- Provide transparent and flexible approaches to programming and scheme prioritisation.

• Relates defined corporate aspirations to maintenance activities and spend.

Illustration of an Principal (A) Road Lifecycle

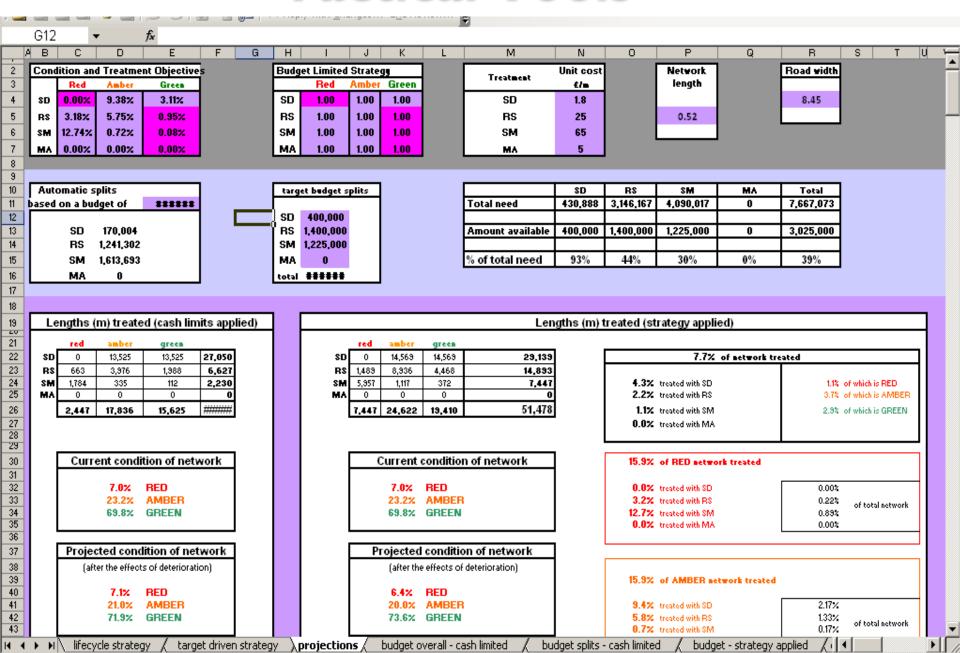

#### Tactical tools have been developed for carriageways

- Optimum lifecycles have been developed for all road classes.
- Budget/treatment options can be adjusted to meet specific outcomes.
- These outcomes can be whole life, condition target, stakeholder or a combination of......

# **Local Programming Tools**

# Local tools have been developed for carriageways and drainage programmes

- These can be cross-referenced and adjusted to accommodate route strategies and forward planning.
- The programmes use both condition and value engineering criteria to prioritise the programme
- The criteria can be loaded/weighted to accommodate changing objectives.

# **Local Programming Tools**

## Lifecycle Planning - Next steps

#### Footways -

- Presently collecting condition and inventory information.
- Development of footway lifecycle plans based on hierarchy, condition, material and reactive repair frequencies.
- Develop simple treatment option tool.

## Lifecycle Planning - Next steps

#### Drainage

- Presently developing a data strategy which considers the needs of the asset and the requirement of the FWMA.
- Will be developing lifecycle concepts which will focus on the at risk parts of the network with routine condition surveys, renewal and improvement strategies, whilst maintaining the remaining network in a 'steady state'.

# Lifecycle Planning - Next steps

#### Other assets

Structures, ITS -

- well documented asset records exist.
- Issues of obsolescence and structural failure are normally funded.
- Further development of lifecycle planning to identify and cost major refurbishment programmes.

#### **General** issues

#### Refinement of initial judgements i.e.

- modelling deterioration
- refine cost coding, improve records
- review condition/depreciation and other outputs to objectives and investment models.
- relate lifecycle objectives to an improvement in customer perception

# Thank You.
